Glass-mounts and tying-in with the AM/FM --
I think P.T. Barnum said it best: "There's a sucker born every
minute." Products such as these are nothing more than flashy "toys"
aimed at yuppies, newbies and village idiots.
I'd seriously advise you to steer away from the brightly packaged
stuff you (more than likely) saw at Wal-Mart or Radio Shack. Cheap stuff
up front is even cheaper junk down the road.

Real mounts --
If you're planning on running w/ a shell and w/o a shell, then I don't
personally know of any hide-a-way mounts manufactured at present. I can,
however, tell you how to build hide-a-way mounts fairly easily and how
to hide the store-bought mounts pretty well also.

Give us some specific vehicle information (year, model; ext. cab, crew
cab, std. cab), as well as how the shell will attach to the truck, and
maybe we'll be able to help you out a bit more.

the "hidden" am/fm/cb antenna's really stink .

through glass work great for scanner , but not for transmitt .

easiest is to get a wilson or k-40 mag mount and put it on the roof top of the cab .

12. Cobra Magnum 4500 amp & SWR's

Newsgroup: rec.radio.cb
Date: 2000-05-01 00:00:00 UTC
From: rgray@kc.rr.com
Message-ID: <936P4.3272$_I1.27397@typhoon.kc.rr.com>
Source record: 33735

In my 98 Dodge Ram extended cab , I am using a 2950 HP pushing a Cobra Magnum HD amp into a wilson 1000 mag mount on the middle of the roof..the problem is that in channel 22 the radio BYITSELF with the antenna is about 1.1.1---1.2.1 SWRS..when I click on the amp the SWR's shoot upwards to around 1.8.1--2. I HATE that much deflection and it cannot be good on either the amp nor radio...how do I set this rig up...if I remember right the higher in freq I go the lower the swr's (with the amp on) can hardly beat 1.1.1 (barely flicker the swr meter)

Thanks a bunch

Ron

Hey Rich,
Broadcast station transmitter sites are usually geographically
seperated from any significant concentrations of people.

Speaking of mental giants...

Guess you don't realize how broadcast stations actually work. The transmitter is very seldom located in the same facility as the studios, business offices, and so on. The station signal is produced at the studio, and then is uplinked to the transmitter site, either through hardline or via microwave, where it is received, repeated, and amplified to the final broadcast output power of 10, 20, 50, or however many kilowatts. The transmitter site can be removed from the studio by several miles, effectively and safely removing station personnel from any effects of the transmitter site. By the way, to further your education on this topic, it's not being in proximity to the transmitter that is hazardous, but nearness to the ANTENNA which is dangerous. Perhaps you've already participated in too many of these keydown demonstrations...

Ray

That is really what I thought deep down. I was thinking that stray RF was enough to "influence" the meter into a higher reading...However if I ain't sure I ask questions......

Also can somebody suggest a decent meter...(I know bird) but I really do not want to spend a zillion dollars on a meter if I can help it... :)

thanks for the reply

Is there any possibility that the power has been turned up in this radio? If so, the power may be too high to allow full, clean, modulation (there is not enough power left after the carrier eats it up). Try turning the carrier power down a little and see if that improves the situation.

Dwight Stewart

Not true, Ray. There is stray RF around any transmitter. Now, while the transmitter shielding will reduce the level of stray RF, it will not eliminate it completely. Now, with the low wattage, and MHz, of the typical CB, this stray RF should not cause a problem. However, if the power is increased, or the transmitter shielding removed, the stray RF around the transmitter could have serious side effects.

Around higher frequency radio devices, even low levels of stray RF is a concern.

Dwight Stewart (W5NET)

I could not agree with this statement more. I mean, its just like what i said about cola. Did eveyone have a fit when coke and pepsi were out and then r.c....give it a rest. If anything, all you guys that are pro dave you should be somewhat flattered like he said that someone wanted to make an amp and chose to use daves design. I've had other business owners come to or call me in the past to find out what product i'm using or how i'm doing something. Kind of makes me feel good that others admire the way i do things.

28. Yaesu YC-601 mod's?

Newsgroup: rec.radio.cb
Date: 2000-05-01 00:00:00 UTC
From: Speedbuggy714 <galaxy1@zoomnet.net>
Message-ID: <XgaP4.597$E6.296665@nntp3.onemain.com>
Source record: 33801

Does anyone have the modification to convert the YC-601 frequency
counter to read the 26 and 26.5mhz frequencies?

I have the mod for the YC-601B but it is different than the
straight 601. I also have the service manual with schematics for
the YC-601 and could probably figure out the programming for the
frequency read out positions but I though if someone already had
that "dirty work" done maybe they would share it with me. I
would be willing to pay for the information as long as it is a
proven working mod. If anyone can help please e-mail me at
galaxy1@zoomnet.net I do not get to the NG as often as I would
like OR if you want to post any info. here for others to view
that would be great!!
Thanks!
Mike

Jay,

I did not meet you at the shoot-out. I hope I will at the next. In fact, I think you came over to my Suburban in the far parking lot. It was on the other side of the 64-pill. At the time I had a black Francis Amazer on top and two new alternators on the drivers side with no belts on them. Sound familiar? I got there too late to enter the event but I did get a chance to go up against the 8-pill winner in a private grudge match and beat him twice (Watergate Rollin!).

It always amazes me that people wanna go spend money on low profile antennas...when one of the most low profile and most effecgive antennas available...cost pennies... When I had mine up and running, I talked to 23 States and Canada with a QRP rig.
You can build and maintain an extremely low profile Dipole antenna for mere pennies. And you can have more than one made to create a phased array, or a full sized Rhombic. There are lots of cheapy wire antennae ideas in old 73 magazines in yer local library.

I have both the 2510 (Uniden/President) and one of the first RCI2950's
that came out. I love my Ranger and will never get rid of it. Love all the
features etc...and is one Boss DX machine. Its controls and how it
maneauvers around the freqs is alot easier than the 2510. In short..its my

radio of choice. Love the split freq option also.

However, I dont wanna take nothing away from the 2510... It too is a class act by itself, altho a bit clumsy to use in a mobile setup. No external hookups for speakers or keys is a major drawback, and the freq controls are difficult at best to use when yer stationsary, let alone crusing.

I use both radios as base units and as mobiles. The SSB and FM on both are complimentary to each other.
Both can drive a decent midsize amp, or standalone work just peachy...

If your upgrades work why arent they winning any keydowns anywhere ... Pure BS ..
And if the person doing these upgrades was so smart everyone in the country running davemade and xforce
would take them and have them .. ummm upgraded and this person would make a small fortune...or they would build there own amp with these upgrades included either way it is BS

.

although 27.555 usb has been jammed for quite some time now in the afternoons
its still the best overall freq to hear world wide stations on a daily basis.
26.285usb is the next best and a lot more quiter. you can try 26.720lsb in the
evenings for the guys in new zealand and 27455usb for just about every south
and central american country.

hi ron, different prefixes for doifferent states all stopped many years ago.
the problem with that system is that it didnt allow for people outside the USA
to be indetefied by other pirates. with 11 meters being such a world wide band
its neccesarry to have prefixes for countries instead of states or provinces so
you know where your hearing and talking to a little faster. the guys that are
worried about id'ing every state are looking at the small picture when it comes
to dx.

Reread my post before you reply again, I said the guys that service these units, not the DJ's. I have a friend that lives about 3/4's of a mile from WBAP's towers in north Texas, I believe that they are a 50 KW transmitter, he has problems with everything in his house, the screen on his backdoor even hums from the RF. He called the FCC and they told him there was nothing to worry about. You cannot take a field strength meter anywhere in his house without getting a reading. His family has live at this same location for 50 years and no one there or that has lived there have ever had any problems linked to high dose's of stray RF. I don't see where there is harm in being in close proximity to "keydowns" for a couple seconds a couple of times a year, totaling maybe 20 minutes, these claims of 70,000 watts are not common and most "keydowns" never have wattages anywhere near this high, it seems safer to me than to transmit on a 2 meter rig with a 50 watt output with the antenna mounted on a hood mount 3' from the driver, most of these guys key their transmitters a lot more than at any "keydowns" and see a hell of a lot more stray RF and at a much higher frequency, flame on, I know its coming.

I have been using an active (DC powered) PEP reading meter lately. It is the Yaesu YS-60 . It's bandwidth extends from 1.8Mhz thru 60Mhz.. One need only speak in a normal voice and the meter reads true peak envelope power. No need any longer for whistling, shouting or anything else. The meter does it all. It is around $129 at HRO and AES.

SWR meters tend to become less accurate the lower in power you go because of the diodes in them. This is true even for the the Bird 43. A lot of times on a Bird you have to change slugs to read the reverse accurately enough to get a good SWR reading but if it is so low that accuracy becomes a problem who cares. The ones that don't use the slugs are much worse and generally read SWR to be much lower than what it really is. Harmonics can and does cause inflated SWR readings but there is also the possibility that the reading you are getting with the amp is more accurate than without it because the typical CB SWR meter is more accurate with a little power than at 4 watts. I would retune the antenna using the amp. It is not unusual at all to find the SWR to read nearly 1:1 at low power and about 1.5:1 at a 100 watts or more. If the amp is clean the reading at the high power level will be more accurate. Your 1.8:1 reading is just about what you should expect.
The one channel SWR reading tells you almost nothing. Ideally you should check it at five or six channels across the band or at leat on 3 channels, the ends and middle to get a picture of the SWR response for the antenna. This will let you know whether the antenna is off resonance or if it is resonant but there is an impedance mismatch between antenna and cable.

63. Newbie type question on 5 x 5

Hi all,

We live in a farming community and use CB radios to stay in contact as telephone lines are frequently cut.

Most of the participants in this "network" are elderly / total amateurs (like me) when it comes to CB radio.

Our daily radio check (to see if everybody is OK) is more of a Hi, are you all OK? - i.e. no lingo.

But it is important that we knoew how well we are receiving / sending

Thus (at last!) my question -

can someone tell me in layman's terms what "5 by 5" means

can you get a 4 out of 5 or a 5 out of 2 ?

any help appreciated

Spike

Hello !!
I'm looking for a 3 way mirror mount with 4 bolts (like the Valor style) double grooved. My only problem with the valor is that it's aluminum, it holds much better than my firestik mount, but is a much worse conductor. I want a Stainless Steel model. The Firestik stainless steel only has 2 bolts. I want one that has both good features. Does anyone know where I could get a 4 bolt Stainless Steel 3-way mirror mount with a double groove ??? Let me know !!!

I did not know anyone still did that any more. Even the state police were I live is supposed to monitor channel 9. I saw a guy broke down on the side of the road one day and called for help on channel 9 hoping to get the police. But never did get anyone. and the police are in the area all the time looking to make money by catching speeders. What ever happened to surve the public. I think the only time they want to serve is when they can serve a ticket to get some money. So I have have been considering on start using channel 9 as any other talk channel. Also thats not the first time I failed at getting anyone on channel 9. I did not stop and help that guy because its too dangerous these days. If I stoped and he was up to no good and I defended myself I would have to deal with the cops. And they only care about putting people in jail. or writing fines. nothing else. They dont care if you were in the right. So its safer not to help people in need if you dont know them.

just my 2 cents worth.

We are still out there. REACT has made a move to GMRS but there are still a bunch of REACTers still monitoring ch#9 CB. If you want any info on starting or joining a team in your area check out REACT international. In our farm county there are still farmers and others using the CB quite a bit and we stay busy monitoring. You are correct about the cops not monitoring but around here we get along good with the PD's because we are organized and they know we are reliable. (as reliable as you can be passing on information from the CB) Our team also works with the county as emergency communications volunteers and we are also trained in wilderness search and rescue.

REACT INTERNATIONAL http://www.reactintl.org/

because they are the easiest vehicles to set up. they have been used
for years so it is easy to get ideas from others. they have the back
area to put stuff, that you need to put there, amps , batteries ,etc.,
engine is strong enough in stock condition to run multiple alternators,
the 350 is a good engine, no doubt, and there is enough room in the
engine compartment to do what you have to do, perhaps others will have
other reasons to add to this list,.....cd is out........

So what? More drive doesn't change the class, as you have implied.

>Amps that conduct for 120 degrees will work fine for AM providing you have
>adequate drive available to get over the negative barrier and you have a
>high enough Q output circuit to clean up the wave. It's done all the time...

By "its done all the time" you mean using a true class C (one
with around 120 degrees) would or could be used for a linear amp?
Sorry that would not work fine, unless you don't care about
distortion. You don't use class C for AM unless you apply modulation
to the finals.

>you know whether the antenna is off resonance or if it is resonant but there is
>an impedance mismatch between antenna and cable.

Ok to follow up on this...I failed to add that I did check it on normal cb band..meaning check it on channel 1 then on 22 (channel I run, rather than 20 middle of the band) and 40. Swr's are higher on 1 than 40...I tend to run in the higher freq's like 27.405 rather than the lower channeld...so to me this tells me my antenna is abit short if I wanted to run lower freq's. And before the freebanding police get involved please note the freq's I am talking about!!!! 26.985 - 27.405. Besides that I am legal in the 28 MHZ band anyways.. :P

the first number in a 5x5 is the read ability on a scale from 1 to 5 with five being perfectly understandabale without problems and 1 being very hard to understand. the second number in 5x5 is the signal strength as judged by your radios s-meter. it is usually 1 to 9 and if its stronger then 9 it will be 9 plus however many db's over it is showing on the meter. ps where do you live spike?

96. Re: Antenna problems

Newsgroup: rec.radio.cb
Date: 2000-05-01 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <390df915.2046561@news.iserv.net>
Source record: 33915

Greetings!

First, do a little shopping to see the prices of all the stuff you're asking...and run a total for the different setups...

For instance...
The all-in-one combos use the AM/FM antenna with a splitter. Cost? $19.95 to $30.00 - cheap, and works cheap...

The splitter matches the radio to the antenna and the cable it uses, but the radio uses 50 ohm impedance cable and expects an antenna to be the same [50 ohm].

A typical AM/FM antenna gives you 72~75 ohms impedance, and the cable used to pipe the signal into the radio - is the same impedance.

The AM/FM antenna is much, much shorter than what you need it to be.

With all of the above, that limits your ability to even transmit or receive very far.

In a word, forget this idea...it won't work for your expectations and you'd waste your money.

Same of the above, applies to those "Stick-on-the-glass" No Ground Antennas - or NGA's. Cost? Between $20.00 - $50.00 - you have two selections - one without a ground pigtail, and one with. If you decide to use this idea, you're on your own - but use the one with the pigtail for ground at the antenna - and use it too. There are a lot of different reasons for staying away from this idea too...

Sure it looks dynamite, but note the size, it's not very efficient at the longer wavelengths the CB uses.

They're fine for Cellular, but not for CB.

Since you've expressed a concern over the cab versus a topper, I would recommend a single CB antenna on the cab roof, either using a mag-mount or permament. This way you avoid the problems of what to do with re-mounting the antenna when the topper goes on or off the truck.

Besides, a few side benefits are the reception pattern, and a lot less things to mess with in case you have tuning problems. One less cable for the coax, and the extra $$ spent on buying two mount and the phasing harness, you can get a great SINGLE antenna that won't leave you disappointed to go on that single mount.

On Sun, 30 Apr 2000 18:05:53 -0700, while the modem was pondering it's
navel, J-Bird <stewajayNOstSPAM@uswestmail.net.invalid> dissertated
the following:

>I have a FORD pickup and I would like to put a cb radio in it and I
>don't know what to use for my antennas. I am thinking about puting twin
>whips in the pocket holes but I might put a topper on it in the winter
>so i don't know what to do Because I don't want to see the brackets.
>What do You think about thru the glass antennas or tieing in with the
>fm radio. Thanks J-Bird

The 55 refers to the first 2 numbers in the Readability-Signal Strength-Tone, or RST system. The first number references readability. A 5 indicates perfectly readable, 4 indicates readable with practically no difficulty, 3 indicates readability with considerable difficulty, 2 indicates barely readable with only occasional words distinguishable, and 1 indicates unreadable. Signal strength numbers range from 9 to 1, with 9 indicating extremely strong signals, 8 indicating strong, 7 indicating moderate, 6 indiating good, 5 indicating fairly good, 4 indicating fair, 3 indicating weak, 2 indicating very weak, and 1 indicating faint, barely perceptable signals.

The transmitter is not the problem--it's the resonant antenna that will get you. The guy performing service is smart enough to turn off the equipment first. If the mental giants could set up their antennas some distance from their 20 year old Suburbans, they wouldn't be in such risk of cooking themselves. but then, if you are reading this and thinking 'hey, how did he know I had my antenna on top of my 20 year old Suburban', then it might be too late to worry about it.

103. Re: Cobra Magnum 4500 amp & SWR's

Newsgroup: rec.radio.cb
Date: 2000-05-01 00:00:00 UTC
From: Bill Eitner <kd6tas@netzero.net>
Message-ID: <390E0691.E710D150@netzero.net>
Source record: 33922

Tuning an antenna with the amp on is asking for trouble. Any
experienced CB tech will tell you that. Having the amp on sends
you on a wild goose chase because changing the load the amp sees
will change the amp's harmonic and parasitic content. Some amps
are more stable when operating into loads other than a purely
resistive, 50 ohm load. Therefore, tuning for lowest SWR with
the amp on can detune what was a properly tuned antenna. The
result is a lower amp-on SWR *and* decreased system efficiency.
This is especially true when running a mag-mount. Mag-mounts
are not the best high-power antenna choice. That means you
shouldn't expect everything to be perfect when running an amp
(especially one that's bigger than a 2-pill) with a mag-mount.

SWR is far from the last word in system efficiency.

Tune for maximum field strength and check the amp-on SWR when
the field strength is maximized. You're likely to find that
the amp-on SWR is far from flat. It'll probably be close to
what it is now since the antenna is properly tuned right now.
System efficiency is what counts. Substitute a dummy load for
the antenna and the amp-on SWR will be flat, but the field
strength (a better measure of system efficiency) will be low.

Think about it. It's not uncommon for the inexperienced to
put way too much value on SWR readings.

Hello Miles: I'll try to make it back to the shoot out there, and see ya on the old eye ball.

I may have missed ya all together, I was really impressed with the 64 pill amp and all the goings on. One of the guys wanted me to enter in, but my set up is for SSB and has a weak AM output, I don't even think the radio has been modified.

Good deal on the 8 pill private grudge match, you will half to show me all your stuff. After Steve showed 947 the GM crank pulley spacer, (that allows another GM serpintine pulley to be used) we hauled out of there. It was about 1.45PM when we left. Had a few more stops to hit when were in the big city, and didn't get back to the high desert till around 9PM.

If ya can, please remind me. Steve may want to go again, I think he has more stuff to show 947.

Hello Jerry: Yeah what EXPORTSRUS said.

The Suburbans have a very large roof area, and we all know that the more metal ya have for a ground plane the better.

Also theres a few miles of room for all the CB go to war stuff, and the kids. During Desert Storm in Saudi, there was a million Chevy Suburbans, just like you see Hondas here now.

The thing that really got my attention was the poor guy driving the very nice and new Suburban, with 2 to 3 wives in it with all the kids, he had to want to shot himself. I can't image getting my ass chewed out from 2 or more wives, and all the kids screeching for a 500 mile drive.

What kind of radio do you have? Do you only have the legal 40 channels, or do you have extra channels above and below 1-40? Do you have SSB?

There are many good amps, but make sure you have a good antenna. The antenna will make as much or more difference than the amp. The SWR must be low or you might damage any amp you put on it.

There are probably 1000 or more places in the United States that
know how to match a radio to an amp.

I'm glad you're happy with your 99 and DX250, but don't for a
minute think that exportradios.com is the only place that can
supply a radio and amp that works right.

G SEVEN,
Having 'listened' to lots of them, use a Heil HC-5.
Don't bother with the dual elements or 'gold' line, they
are a waste of money. Also, turn off the processor.
You might see if you can find the original 'hand-mic'
that came with all the Kenwoods, the MC-43. It works
well too.

RE: Muffled audio

This is a very good point! I have a wattmeter
and will check the carrier levels of the muffled
and non-muffled units. If the muffled unit has
a high carrier output then your theory may be
correct.

Thanks for the idea!

-CT

->
> Is there any possibility that the power has been turned up in this

There used to be a box that would let you use your CB antenna with yor AM/FM
radio. These were fair on CB, great on FM and flat out awful on AM.

i just got a galaxy v99 and a texas star dx250, from express electronics
they set the radio to the box. its awsome, i talked to the west indis, jamaca,
all over on ssb.in the car yet.
guys if you want the perfect match radio and linear. go to www.exportradios.com
i swear you wont be unhappy ,,,,,, a happy camper and dxer for 20
years.....
also does anyone remember the black cat linears from wowassy electronics?
please
reply.....

This mic is in great condition and has all the toys. This is quite possibly one of the loudest micrphones available today. Mic is fully operational and I will throw in a 9 volt wall transformer to save on batteries. The mic is a hold over from my CB days and I do not have a use for it. IT is not currently wired and can be wired to any radio you like for 5.00 more(to cover the cost of the plug). I would like 50.00 + Shipping and would be happy to answer any questions you might have through E-mail.
Thanks for the read,

I must concur with this.Two weeks ago I bought a Ranger 2950 EX HP and a Palomar Magnum 4500 plus a wilson 1000 mag mount ant. from the same company. They set the radio with the amp..awsome is all I can say. I talked to Mike there. He answered all my question with correct answers. (at least everything he said about what they were going to do..and want they did was 100%)!!!!

And yep..we had a 250 watt black cat amp in our brand new 1972 ford truck..the amp itself was under the hood and all we had under the dash was the remote..it was tube type if I remember...I know this much, it really loaded that 460 down when we keyed it..trying to remember which Pace 23 channel radio we had at the time...

Bill...

You have really been helpfull to me and THIS is not a flame towards you in the least bit...however I took his post as a witness to a honest place to buy a radio. The internet has made it a rip-off haven for some. I too shopped at www.exportradios.com and had good luck. BUT I am not saying that they are the only place. IMHO getting ripped off once is once to many!!

There is a "dealer" out there that has a impressive web page..even has three telephone numbers...call either of those numbers and you get Ecno-lodge..to make matters worse he as a PO box number as his address...PLUS the fact he does not take credit cards..(ok credit cards I can understand but to me they are protection for both buyer and seller) I will not disrepect this guy by posting his web page but if anyone is interested I will be happy to e-mail the info..THIS IS NOT A STATEMENT THAT HE IS DIS-HONEST IN ANYWAY!! It just did not give me a warm and fuzzy feeling!!!

As I have stated in another post. We had one in 1972. What I can remember of them is that is was a LARGE box that was under the hood and tube type. The remote was in the cab. The biggest downfall we had was tuning the darn thing. It is not like the solid state amps of today, and if you were not carefull it was easy to blow up!!! It all depends what you want to do...myself I am not a mauler...just wanna be heard across the street...Soild State is the way for me myself and I. Your mileage may vary!

I try to come through the booming stereos in cars next to me. I
can get a response about 1 out of ten times with a two pill.
Usually they turn down the volume, they can't figure out what's
happening to their stereo! Good luck frying their radio. It would
take a 70,000 watt mobile to create that kind of EMF!

If he has a harmonic problem chances are tunig the antenna will not do anything. The AMount of harmonic energy reflcted back will stay relatively constant and his SWR will read slightly worse as he changes the antenna length. assuming his antenna is tuned correctly and the 1.8:1 SWR is caused by harmonics the SWR reading will just not get any better but it will not hurt a thing to try. The benifit of doing this is that he will either lower his SWR or he will discover that his amp is putting out more harmonic energy than it should or discover that his antenna could be a liitle better of a match. Neither senerio should send anyone on a wild goose chase. If he does discover that the reading is caused by harmonics this will give him the opporunity to do something to improve his signal and not ignore the intrfence he may be causing. At worst if he makes an extreme adjustment to his antenna he could always

switch to low power and set it back. I like to give the guy the benifit of the doubt that he has at least average common sense and knows to adjust a little and check the results, if it gets worse he can adjust it the other way and check again. While it is possible that his mental capacity is not this acute I will not insult him by assuming this is the case.

With 40 channels AM, you will have lots of competition from others, so you will need at least 200 watts or more to be heard above the noise. Lots of manufacturers make verticals, but make sure to get one that can handle 200 watts. A good 5/8 wave without coils would do the job, Maco and Solarcon make good ones. What do you consider DX? Across the country, or across the world? If you are looking for worldwide DX, then you should get a beam antenna and a radio with SSB. Not too many foreign stations, with the exception of North and South America, run AM. Most are on SSB, and many operate outside the regular 40 channels.

SpamHater,
Sorry, don't know where to find one, but can tell you
this. Performance is very disappointing. Almost ANY of
the 'clamp on', or 'magnet mount' antennas will out per-
form the AM/FM/CB combination antennas.
'Doc

John Doe,
While I agree with you about the 'thumpers', unless
you can get withing 'touching' distance, the level of
power needed to 'burn out' the 'chips' would need a
440/3phase power drop to your house! Just not practical.
Oooh, but wouldn't it be nice!!

Well I checked the power out with my Diamond SX-1000
wattmeter. Both the good and bad units each have
a carrier output of about 1.5 watts using the battery
pack and about 2.5 watts running from a bench supply.

Cobra is going to mail me the schematics.

Will advise.

I had one in 72 or 73 while living in Ft Lauderdale Florida. It was a solid state mobile. There was a place somewhere around Pompano Beach Florida or on Powerline Road, that made them. Some of them featured a remote feature for mounting in the trunk. Dirty little buggers, we use to drive by houses with the out door accordian style hanging pool lights and wreck havoc. They also would broadcast over the radio of the car in front of you.

166. Re: AM/FM/CB Antenna

Newsgroup: rec.radio.cb
Date: 2000-05-02 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <E%BP4.18466$g4.493654@newsread2.prod.itd.earthlink.net>
Source record: 33889

Well, first off you have to decide how important performance is.

The antennas generally come in three varieties. One they 'look'
like a CB antenna, maybe even having a coil visible. These
compromise performance somewhat, but should still be about
the level of the shorty/crappy mag mounts. They are longer, but
mounting on a corner of the vehicle really affects the pattern.

The next type is 'disguise'. In some cases they are simple antennas
but much longer than normal. These degrade performance further,
but are harder to spot.

Finally there are the true disguise antennas. These are EXACTLY
like AM/FM antennas, right down to the EXACT mounting hardware
that shows on the vehicle. They may not be available for all cars.
Avanti (I think it was) for example only made 'Chrysler' antennas
with the 'large' mounting nuts. They would work on a the vehicles
with the small nut, but if someone knew what they were looking for
they were easy to spot. These by the way are the most expensive.
Antenna Specialist I think used to have a full catalog for these. You
could get single band antennas (they wouldn't work on AM/FM)
dual purpose, even multi-band. But be aware, some of these were
tripple digit prices, and not 1 or 2 as the first digit. If disguise is
really important to you....

Radio Shack used to carry two antennas. One had a coil in it
and was easily spotable. The other was a disguise but was a
'generic' mount. They aren't carried in the current catalog, but
may still be obtainable if you find one in a back room kind of
thing. Both were AM/FM/CB.

Crutchfield used to carry them, and may still be able to get them
for you. Otherwise, try Larson, Antenna Specialist, Avanti, and
others. But be aware, they are now 'specialty items' and will
command relatively big bucks.

As to performance, form something like an A/S antenna I
wouldn't expect it to work better than say a shorty mag mount
or one of the cellular look-alike antennas for CB. Hmm, that
may be the way to go... Those are fairly discrete. But not totally
disguise.

The real bottom of the barrel is the 'converters' to use your
regular antenna as a CB. These things are the pits for performance,
but if you don't care... They are still available from places like
J.C.Whitney.

<kd6tas@netzero.net> wrote:

> SWR is far from the last word in system efficiency.

On the contrary, it is an excellent measurement of the ratio
of power being transferred to the load. How can full power
transfer be considered less than efficient?

> Tune for maximum field strength and check the amp-on SWR when
> the field strength is maximized.

This advice is impractical. What is he supposed to do? Look through
binoculars at a field strength meter 100' feet away while he tunes
his radio?

He should take practical and valuable approach of tuning his antenna
for the best SWR. Then he is guaranteed that maximum power is
being transferred.

HelloAll,
I have a
Cobra 29 Cb radio
This is a older 23 channel radio with
ANL,NB,Dynamike,deltatune,volume,squelch,and rf gain knobs
It does power up and recieves
do not know if it transmitts as i was just using my 2 meter antenna

I found this laying in my gargage do not know if it works 100%
Has mike also

Best offer takes it as I would hate to just toss this away if someone
could use it

I can send pictures if you need them

Thanks Tiny

I had great DX too last night here in Arkansas, had alot of contacts with the East coast, which is something I have not heard in a while.

Right now we are getting thunderstorms, so I am too scared to hook up the antenna.... but maybe tonight will be a repeat of last night's SUPER PROPOGATION!

NO NO NO, DO NOT DO THAT

The RF power is going into the other radio instead of the antenna. Get a switch box before you blow up BOTH radios. Who knows what your SWR is, but I bet it is out of this world!

Good question ... and the answer is absolutely nothing. I worked DX in every kind of weather condition. And I don't mean some exotic spot like Dayton.Ohio either but instead to the other side of the planet. Real DX with real radios. Get real .... dump 11M.
Get a Ham Radio ticket...it is easier then ever right now.

I can talk to any state in the USA (given good conditions), plus have made several foreign contacts (australia, west indies, brazil, argentina, etc) using jus t25 watts and an Antron 99. My radio puts out 25 peak on SSB, but I have turned it down (variable power) and actually used 5 watts peak SSB power to communicate with many stations. Basically, if I can hear them, they can hear me 90% of the time.

If you MUST have an amp, 200 watts or so would be sufficient if you are using sideband.

Freeband is great, monitor 27.555 USB or 27.515 LSB for good contacts.

Source record: 33967

I have a 142 GTL. I tried several different mods out there myself until I finally settled on just a basic tune-up and changing a resistor in AMC circuit to achieve just over 100% modulation. There is also a 2SC1674 transistor in the receive circuit you can replace with 2SC2999 and with simple adjustments, improve your gain & signal to noise ratio by about 6db.

Positives about the 142: 26.815 - 28.045 coverage is easy with existing PLL.
Negatives: Single conversion radio. e.g. can't be mod'd for FM.

Don't waste your time trying to get more out of the radio than it was designed for. Go for best performance with standard tune-up and attach a good linear for more power.

Regards.

The Pennsylvania is a very long antenna...83 inches, I think (can't remember exactly). I have one and have found it to be very broad banded. I use it on 10 meters, but it is also useable on the CB band without retuning, which is quite handy on trips. SWR is easy to set with an adjustable coil. The gain figure is probably a little optimistic, but the antenna works VERY well. The only disadvantages I'm aware of are that it is kinda funny looking, and that it tends to hit trees because of the size!

Sorry, guys and gals, I was called away on business (had to drive the truck) and I guess our discussion on materials for that loaded dipole I run on the truck, etc, got pruned.

Hamm4fun, I believe it was you that said that PVC was a poor material for a shaft for such an antenna. Did you have a suggestion that I missed?

As for the pond scum issue, if JR answered, I missed it, because of my line of work. ::grin::

Hope to hear some suggestions. I'd love to get this antenna more efficient, if possible.

-CGP

203. Is channel #9 still for emergencies?

Newsgroup: rec.radio.cb
Date: 2000-05-02 00:00:00 UTC
From: paul and jacki <jacki2@gwis.com>
Message-ID: <390F9386.3B83@gwis.com>
Source record: 33976

Just wondering if CB ch. 9 is still for emergency radio traffic only. If so, do police agencies in Ohio and elsewhere still monitor ch. 9? I hear lots of non-emergency, "soap opera" type traffic on channel 9 (i.e. "how's your rig runnin'?" "just got back from the coast," etc.).

204. Maxon MCB-30 vs. Uniden Pro510XL?

VR6 and VR7 go hand in hand with modulation and VR8 controls AM power.
CT7 controls SSB power. OK, VR7 controls max modulation setting and
VR6 is like a mic gain control on a power mic. Here is a secret that
I use when using a stock mic or a NON-POWERED D104, is short the bar
ends (cathodes) of D21 and D22 together (VR7 may not work after doing
this, but you modulation level is unreal. BUT BUT BUT you must be
using a stock mic or any NON powered mic.

>Just like
>jazz, rock and roll, rap music, and street fashion, black america has created
>its own unique version of ham/cb radio.
>

With all respect, keydowns, Suburbans and big amps were not started by black America. The amount of black people mentioned is not surprising because it was in Los Angeles. If you went to one of these meets in Kentucky or Minnesota or New York, you'd get a different combination of 'majority' attendees.
I doubt very seriously that African Americans started the facet of CB/ham radio that you attribute to them.
That being said, please understand that I am not trying to deride Black America, and the other art forms you attribute to the culture are quite correct. But I'd be hard-pressed to find and cite sources which indicate the predominant influence of African American culture in the CB "big power" boom of the late '60's and early '70's. My thoughts would be that it was started most likely by gas shortages, truckers (of all 'colors') and middle-class workers who needed an outlet and a glorified way of communicating to their world.
I'm sure there are some 'old-timers' in here who can correct me and give their information, too.
Linus

I run a base setup with two cb radios (one ssb, one without).
Is it ok to hook the two radios to my single roof mounted antenna with a "T"
connector? I tried this once and when I would key radio "a", the rf needle
on radio "b" would swing.
Basically, will this do damage to the radio not being used? It seems like it
still swung with the radio not in use turned off.
Thanks,
Ken

All the D&A Phantoms I have seen have a preamp. The switch is on the back marked blt. Usually the pre amps don't work though. They have long since been burned out by the time I see them. The pre amp circuit is in the schematics for several D&A amps. The later brown and tan Maverick's and the PDX series have pre amps too.

Not good! Get a coax switch or change the coax to the in use radio.

Ken,
I don't think I'd want to do that at all. As you can
see from the 'needle' moving, even with the radio off,
there is a significant amount of RF getting into the
un-used radio. And your right, it will 'burn out' the
second radio! Using a coaxial switch is 'better', but
still just as bad. Anytime you have two radios tuned
to the same 'band', in the same station, your 'tempting'
fate into 'bitting' you. There are ways of doing this
safely (as far as the radios are conserned), but it ain't
cheap, or practical for most people.
'Doc

Yeah, good answer.

Fire up 99 Specs:

Gain: Vast Db.
Rejection: Improvment

Don't forget your 1/2 Wavelength section of coax...very
important.

Bob

Hi all,
I'm looking to invest in a mag mount antenna for my car to use with my old Realistic TRC-418 radio. It's an fairly simple older 40ch radio, for casual use would there be much advantage to upgrading to a more modern/expensive one? I was thinking of trying the Wilson Lil Wil, is this a good antenna? I would like to keep the price down but still have a good antenna and tunablity is a plus. How about some of the Radio Shack option?

Thanks!

Craig

Craig,
First, if your radio is working well, why bother getting
a new one? Unless, you just want something new. In that case,
go for it.
No matter what most people will tell you, most antennas,
mag-mount or not, are about the same as long as you stay within
the same 'class/group' of antennas. The Radio Shack antennas
are as good/bad as all the rest of them. In a very general way,
the longer the antenna, the better. We're talking about the
'electrical' length, not physical length. Of course you want
to get an antenna with a 'strong' magnet, no idea how to make
that comparison!
'Doc

frying the radio won't happen unless you are quite rich,you would need a LOT
of watts.
but if they have an eq you can come over the system quite easily.
most (quality) eq's are delicate and are made to work with low power and it
doesnt take much to blast through.just a stereo will take a lot of outside
rf though you can cover up the stereo signal they are receiving.

Don't be confused. The older 10M rig has a CW switch. The QRZ modification
sheet refers to this model.

The newer version does NOT have a CW position on the function switch, and it
cannot (by all accounts so far) be modified for 11 meters.

Since you want to spend (lose $175.00) why don't you invest it in a 165 amp
or larger alternator an isolator and a dedicated battery.

How about listing it for export use only?.....My question is...Is it illegal to simply build an amp and have it sitting there on your table or do you need actually use it for it to become illegal?

I hope I did`nt brain my damage.

I have a President AX711 for sale. It is in good condition on the outside, excellent condition on the inside. Works and sounds great. Has PA, NB/ANL , instant 9 and 19, etc... Selling only because I'm upgrading to sideband. Letting it go for $169. For more info, you can contact me at hunting01@email.com.

Don't atmospheric conditions have something to do w/ skip? Above Texas, it has been a little colder, and therefore, the ionosphere is not as dense, and the waves go through instead of bouncing off. (I'm probably wrong. I don't claim to be a meteorologist!) Or perhaps atmospheric conditions have nothing to do w/ the sky being overcast...

Regardless, maybe it's just a coincidence, but the skip hasn't been as bad around here lately. (Yeah, I meant to use the word "bad.")

Alas, it must be difficult pondering what kind of lie ("I own it but don't use it") or sleazy loophole ("It's for export") to use.

Terrific hobby you got there, Gents. A big part of it seems to be trading tips about effective methods of lying and deceit.

Why don't you get that 2-way switch from Coppers. It automatically switches between 2 radios. It will work fine.

Yeah PVC is pretty lossy at RF. A popular test for seeing if an insulator is good at RF is to stick it in a microwave oven and see if it gets hot. If it does it failed the test. If you try this put a glass of water in the microwave too or you may blow up the oven. Fiberglass on the other hand is very good. They use this to make pressure windows for waveguides.

> Thanks....

The mods you quote are indeed good for the HTX 100... a rig RS discontinued several years ago. (they are only available second-hand) The HTX 100 does CW & USB.

I think you might be confusing the HTX 10 (the new RS 10m Rig) with the older one. The new one is not modifiable... at least not at a cost anyone would consider reasonable. The new one (HTX 10) does not do CW, but SSB, AM,&FM

I know you won't see 6.5 + gain with it on a mobile. If a
company makes a claim like this I would be careful. 6.5 gain in
a mobile useing one antenna 87"long is a scam. The hieght off
the ground won't let you see that kind of gain. You need to be
way off the ground to see that kind of gain. Your not going to
do that in a mobile. There are many ways to sell gain. Is it 6,5
db gain over what? I don't think it would be over a simple
dipole (Isotropic)(DBI)or just a antenna mount with no antenna
in it. It sounds like a scam to me for a 11-10m mobile antenna
to claim this gain.
73,
Bean

What part of Texas, TW? For the hell of it, one night I decided to monitor ch. 9. You're right... Spanish-speakers galore. Either skipping up from Mexico or right here around Austin. Also, because of NAFTA, there are a lot of Spanish speaking truck drivers among those up on ch. 19. It's funny to listen if you know at least a little Spanish. They just assume that white people don't know any.

Once, someone said, "Pobrecito, no pueden hablar ingles." (meaning: "Poor little one, he cannot speak English."). Boy, they blew up like a volcano, yelling in broken English about how they could speak whatever language they wanted...

Is that the same way you talk on 11M as well? Probably so.....maybe Ham Radio has no place for your kind. Still if you clean up your act and do a little studying and code practice you would be welcome. So which is it..lazy or stupid?

What a great hobby. You have to hide, lie and deceive in order to pursue it.

<<<<<<<<<<<<<<<<<<<<<<<<<<<<

Hey JarryLaw/Alfred Jarry/A Jarry,

You're wasting your self appointed talents here my man. Why are you messing with these small fish that you can do nothing about since you are not in physical contact with them.

If you're really into this "tattle-tale brand of self appointed law enforcement" why aren't you at you're local Ham Fest! The one I was at Sunday was full of good decent God/Government fearing amateurs selling their wares. And guess what they were selling? You got it. 10 meter rigs that were modified for 11 meters & extra power. And amplifiers! Those demon possessed evil 11 meter amps....several "44 Trucker specials", "Road Runners", "Palamors", the list goes on and on and GOD FORBID some of them came with their on CB rig already attached! There had to be at least 60-70 trucker special amps I saw there (no these weren't 10 meter ham amps....these were "bought and paid for at the local truck stop amps!).

And how many HR2510s did I see with that strange little switchy thingy on the back? Usually right there on the table in the open with the 2 foot amateur call letters emblazened on the table cover by this ever so law abiding hams wife. But just to make sure that little switchy thingy on the back did what I thought it did I would always ask (in my most inocent little voice), "has it been moded for 11 meters?" and almost without fail I would get the story of how the seller had talked on 11 meters to S.American, Canada, Europe,....and how it was one hot little radio and usually two or three words of wise ham advice on how I could make it even hotter!

There were 192 tables at that ham fest. I saw illegal items on 41 of them out in the open. At several other tables I was offered illegal items behind the table. And you don't even want to know what was being offered on the parking lot where the "tailgatters"

were set up.

I have learned that at most ham fests if you hang around a table and "rag chew" with the seller long enough you will gain his confidence and he will drag out that little brown box most of them keep under or behind their table with the really good "special" goodies in it!

What I'm saying here Jarry is that something really needs to be done about this situation. And you seem to be just the man to do it. But you have to get away from this "fringe" area and these small fish and put your talents to good use where they belong. You're trying to clean up the backyard when the frontyard is in dire need of cleaning. You're wasting your time trying to bust the users when you need to be going after the "pushers" who build a lot of the stuff the users have. You know the old saying......."clean up your own yard before......"

Man you can be like Jesus with the money changers at most ham fests! You can go through and kick over tables left and right. And it will do some good! Because these people have a license to lose. You can have it taken away from the dirty bastards. I mean it isn't like here in the group where you can't really do anything about it because you don't know who people really are. These guys have their call signs posted behind the tables! You will know who they are! You can actually do something about it! And it's your job....no, it's your obligation as a ham to do it. You know, the "self policing" thing hams talk about.

In closing I just want to say I wish you would put your time and effort into something really useful that helps people. The Red Cross or something like that could really use the energy you expend here reading over posts just so you can make snide remarks that will have no overall effect on anyone. And if you use that same energy in something like that some person will actually benefit from it.

You got it. 10 meter rigs that were modified for 11 >meters & extra power. And amplifiers!

Nobody cares, period. All this talk of "hams losing their licenses" and getting "big fines" for selling illegal CB gear is simply untrue in most cases.

I went down to Orlando Hamcation this past February. For those of you who are not familiar with this event, it's one of the hamfests in the SE United States. I saw an abundance of illegal 11-meter equipment. Modified CB radios, modified "export" CB radios, and modified "10-meter" radios. Also saw at least 100 11-meter amplifiers. Not Heathkits or Henrys...but rather, Texas Stars, Black Knights, and Palomars. Even a few custom-built "keydown" amps (Dave Made, etc.) Amplifiers specifically designed for use on the CB band. All of these were being sold right out in the open, with no attempt being made to even disclaimer them as "for amateur use only" in most cases.

The kicker? Riley Hollingsworth, head-honcho of the FCC enforcement division, was only a few hundred feet away, addressing the local ARES/RACES division. The illegal equipment was being sold before, during, and after his visit to the hamfest.

295. Buy or trade for a 2510 chip.

Anyone have a working HR2510 chip they want to get rid of?
I have a 2510 that has a bad chip (according to replys to my post
about it here on this board).

I don't have to have the chipswitch. So if someone has an orginal
left over after changing to the chipswitch and wants to sell it
or trade it let me know.

Source record: 34019

I just read your problem. I have a couple of things to ask first.

When you did your swr test where you in your truck with the doors closed
away from any power lines, large objects (house) and where your arms in the
vehicle as well as no body was standing neat the car?
And second. when you tried to ground it how long was the wire you used and
what was the gauge of it.

The reason I am asking is that all of these things will effect the standing

wave ratio reading.

Go to the Wilson Antenna Tech supprt site at
www.wilsonantenna.com/support.htm there is a good section on grounding
problems in there. look near the bottom for your supprt index.

Message-ID: <20000503125150.13640.00000996@ng-bk1.aol.com>
Source record: 34030

Hi all , I want to wish all radio-friends Happy Eastern , sorry for my delays , at the moment I am extremely busy ONLY for IR-DX Group , we had terrible QSL printing problems because our Printer had a computercrash. All data was destroyed (all 16 to print IR-DX QSL Cards) , the result was I had to wait till printer was ready to design in company with myself all cards again. (this was the second time .....) After long work in evenings past weeks I received all proofs last Friday , only 2-3 little problems (mistakes) on a few cards but this coming week we will finish this little job , I think after 2 weeks finally I will receive all new 16 cards. I will start QSL wrinting directly and need some time ofcaurse.
For those waiting on QSL's like 121IR-NA01 - 34IR-GOI - 121IR006 - 121IR140 - 131IR-DX (Activation will start if QSL is ready) and new QSL 309IR102 Vlad I give my sincere appologizes for long delays in returning the QSL's to you.
Anyway you will understand hopefully.
I am sure you will be surprised and happy if you receive the 121IR-NA01 QSL , its a bit funny , also 34IR-GOI is a beautifull card.
The whole Easter weekend I spent my time writing already 2200 envelopes for activation 121IR-NA01.
Be free to pass this message to other forums like WWDX - AT Forum.
All radio-friends know me some time already and most know they will receive 100% the QSL Cards from IR-DX Activations.
Please stop sending " reminders " by e-mail , thank you , I don't understand why it is necessary to complain , I remember the times you needed me sooo much to receive 140IR-DX , 200IR0 , 221IR0 , 316IR0 , 319IR0 , 248IR0.....this period I was the god and now ;-))) but I can handle it.
also the German crew (177IR-0 & 253IR-0) had problems with their QSL printer , also this problems are finished and we are all looking forward to receive all cards from printer , our appologizes again for delays in return QSL.
I will try to answer all private e-mails later on , first I like to finish my work , also some people are waiting their packages.....

My first car was an '88 Chevy Celebrity Eurosport sedan, this is
back in 1990 when I got it used from my parents. I used to be into
the linears back then, I believe I had a Texas Star 667 in the car
(went to CAP and bought a high-amp alternator to replace the stock
one) and within two days of putting in the amp (I would use the CB/
amp maybe three hours a day) I had completely "fried" the car's
stock stereo system, it only received the strongest FM and AM stations
and the cassette player did not work at all anymore. My parents had
rarely used the stereo so it's not like it was worn out......

KRS,

Let me ask you a couple questions, but first I want to emphasize that none of this is meant to argue, insult, or cause bitterness. For the average guy, CB does have it's limitations. For the folks who try to use CB for local comms between family/friends, it gets hard to do with all the crowding, and, sometimes, all the skip roaring and howling. If you KNEW that you could take advantage of a communications hobby that would give you FAR more frequencies, FAR more flexibility, and much more satisfaction, would you really let a few buttheads stop you? Not if you are smart. I have run into horses' patoots in CB as well as ham. I have had my share of run-ins with the "channel-masters" who wouldn't let you talk on "their" channel, or would give you hell if they happened to catch you on there. You mean that you have NEVER been keyed on and covered up by another CBer who was being arrogant, rude, and/or profane? Have you ever heard two CBers get into it over the radio, then get in their cars and go looking for one another with guns? I have. It would be funny if it weren't so dangerous. By the same token, I have run into know-it-all hams, too, who hogged frequencies, cussed up a blue streak, and put down anything anybody said or disagreed with. So, is it a CB or a ham thing? No. It is a people thing. There is no inherent difference in CBers and hams, rather a matter of personalities, tastes, maturity--all the traits one will find in all walks of life. On the whole, however, the one thing that makes me prefer amateur over CB is that if I run into those smart-ass types, I can change bands, find something that needs to be fixed (in my shack), OR just cut it off. Ham radio just offers more opportunities, that's all. No flames there. I also find that MOST hams are more disciplined because there are some requirements for earning the privileges one has. Yeah, some folks memorize the answers to exam questions. Some have cheated to obtain the license, some Volunteer Examiners have been caught giving improper tests, and some got caught SELLING test answers, correcting exams so applicants passed illegally, and accepting bribes. Most of them have been caught and severely punished. Don't look at ham radio according to what others do/have done; look at the benefits as to how they may help you get more out of the radio hobby. For if you look, just as in CB, you will find something that appeals to you, far more DX opportunities, if that is what you like, many friends you didn't have before, and LEARN much more about radio--which is not to say you don't know anything (you may be a GROL tech for all I know). I know I did/am! I learn something new every single day about radio, and I don't have to be yapping all the time to do it.

Thankyou Redwire, however, I am not into the 'tattle-tale brand of self appointed law enforcement' that you suggest.

If the only motivation you can think of for my disagreement with spectrum hogs, frequency looters, and overpowered stations is an inflated sense of self-importance, then I do pity your lack of perception.

I am always surprised by the vehement response that any discussion of illegality brings in these quarters. I suspect that many of the loudest and most agile responders have a lot to lose should the tide indeed turn against them.

Now, to the matter of the hamfests. I gather that these purveyors of illegal citizens band equipment were licensed hams. I see that you verified their call letters. I note that you took the trouble to count the 41 out of 192 who sold illegal items. Based on this, I must conclude that you are much better suited for the 'active policing' role than I, sir.

A. Jarry

Programbo,

To answer your question, it is illegal to have in your posession, or on your premises a power amplifier if that premises is also the location of a CB station. Without quoting chapter and verse, the regs state that if the operation of your station is questionable (interference, jamming, freebanding, etc), and, upon inspection, an FCC agent finds an amp, it will be "assumed" that it has been used on CB. A license in another service will likely anull any questions. NOW.....! Having said that, let's look at it another way. If you operate your CB station in a manner that doesn't attract attention in some OTHER way, and the amp is just sitting there collecting cobwebs, you likely wouldn't have any trouble at all. I mean, how would "they" know you had it? It could sit there forever. In the strictest sense, if you read the regulation as it is written, it IS illegal unless you have some type of license. But "they" don't know about it, so it becomes a non-issue. Again, if you get nailed for something else, and "they" find that amp in or near your CB station, they might hit ya fer that as well--even if you never used it, "they" will "assume" you did. How's that for a catch 22?

A Jarry,

Well, I reckon the guy was talking about me, too. At last year's Shelby NC hamfest, I had an amp on my table for sale. I also had a note on it that said, "Must see Valid Amateur license before Sale". I meant it, too! A guy I assume was a CBer came up, looked at it, and left spewing a stream of obscenities. I could not take the chance, tho I needed the money, on selling it to an unlicensed person. How did I know he wasn't an FCC agent? I could have lost my license I worked hard for, maybe gotten a fine. Who knows? I can't speak for those who are willing to press their luck---and I know such sales go on. Having met Riley Hollingsworth in person, talked with him one-on-one, listened to his forums, I can only say that I believe what he says. And he ain't gonna "pinch" me. I know the rules, abide by them, and that's what it takes. If no one believes he is hitting hams right and left for illegal antics, including selling illegal stuff, just visit www.rainreport.com and read the warnings, revocations, and NALs. I am telling you, believe it or not, if he catches you, he WILL nail ya. He's a nice guy in person, but if you ignore his letters, he BITES! And if you believe CB is "exempt" from his attention, well, you best think again. That attention is coming----soon as he gets done with those "bad", "bad" hams! LOL!

Best 73 to all,

Jerry

As it turns out... very good. I have two prototypes in several friends vehicles (Gunsmoke & Stickman) for testing right now here in Chicago. They are used to big 2-pills and they are in disbelief about the excellent performance of this one pill. It's hard getting used to the idea that a 1-pill puts out as much as a 2-pill with about half the current draw and heat...

>turn against>them.

Freebanders have nothing to lose. They just roll over to another
freq when it comes time. On the other hand hams do have
something to lose. And if we don't do something about it in 20
years there will be no ham freqs. God knows what remains is not
deserved. A waste of bandwith used primarily by old geezers my
age rag chewing like two old women over the fence.

>
>Now, to the matter of the hamfests. I gather that these
purveyors of illegal
>citizens band equipment were licensed hams.

Come on J.J. Don't play inocent like you have never been to a ham
fest. Of course they are licensed hams. You know they are. And
you don't do anything about them when you see them breaking the
rules. Yet you hang around here harassing these people in a news
group you don't belong in. Explain to these people in this
newsgroup why you are here harassing them yet do nothing about
the illegal activities I know you have witnessed at ham fests.

> I see that you verified their call letters. I note that you
>took the trouble to count the 41 out of 192 who sold
>illegal items. Based on this, I must conclude that you are much
>better suited for the 'active policing' role than I, sir.

Damned right I counted. And that was only the tip of the ice berg. I made no serious effort to search out illegal items. If I had I'm sure the percentage would have been higher. You know why I counted? For one reason only. YOU. (actually it was a discussion several people at the fest were having about YOU and your input into this newsgroup that made me do the counting.) I'm sick of holier-than-thou annoying self righteous hypocrites like you making ham radio worse than it already is. You are doing to these people exactly what you say they are doing to ham radio. You are infringing into their newsgroup, into their band, heckeling them with crude and insulting remarks (go ahead and read some of your own past posts here and look at some of the adjectives you use to describe some of these people.) There are plenty of honest people who read this news group who take your insults personally.

So until I see you at the next ham fest confront a ham about his/hers illegal activities I think you have no reason to be over here.You have lots of chances coming up to walk the walk instead of just talk the talk. Durham, 27 May. Winston Salem, 10 June. Salisbury, 8 July. Gary, 15 July. Waynesville, 29 July. Shelby, 2-3 Sept. For once do something to really help Ham radio at one of these ham fests instead of hanging around here with your nose in the air.

Now I'm done with you. I thought you would have some better comebacks than you did. But it is hard to battle the truth. Redwire's finished with J.J.

Hi TW,

No, I'm not after just the basic talkback speaker you can by. President sold a external speaker that was matched up to the Washington (or other President) bases. Same kind of setup as the Cobra 2000 base rig with its optional external speaker. I'm after the matched speaker.

Thanks for asking...

Stephanie

I just bought a box of cb stuff at a garage sale. Included was a 5' firestick 2 tunable antenna, and a 9' bottom loaded whip antenna. Which of the 2 is a better one to use?

The radio is a Cobra 29, 23 channel. Is it worth installing? Are any mods available?

Thanks,

Daniel

ps. this all cost $3

firestick makes an antenna that is to replace the top section of
a A-99....it makes the antenna a 5/8 wave antenna, the A-99 is a
1/2 wave antenna... as for the gain, well a 1/2 wave antenna
usually has around 3dbd and a 5/8 wave has 4.5 -5.6 dbd...that
9.9 db gain is the gain of the antenna when compared to a beer
can laying in the yard...

343. battery as power

Newsgroup: rec.radio.cb
Date: 2000-05-03 00:00:00 UTC
From: "A. H." <a0h9065@labs.tamu.edu>
Message-ID: <39110120.C33644D@labs.tamu.edu>
Source record: 34166

Hello everyone...
I was just thinking of how I can get my rig better (something I can't stop doing) and thought the power source.. I am not big on cars, so I followed the directions that came with my radio and connected the power lines to the panel inside the cab, inline with the radio, since I heard that it is the cleanest. But I thought maybe going right to the battery would be cleaner. So how do I do it ?? what kind of wire should I use ?? etc....

344. Re: Need some suggestions and ideas and even criticism.

015 Radio Canada,
Should work okay. Might want to make the 'mount'
for the antenna adjustable in height to help in tuning.
Also might lengthen the radials to about 9 feet (gives
you some length to 'play' with when tuning).
'Doc

Source record: 34169

DukkhaKoti,
I think the other posts explain about changing the
top section of the A99.
When talking about 'gain', unless what you are
comparing the antenna 'to' is specified, it is normally
compared to a 1/2 wave length dipole. Both the A99, and
the modified A99 have a gain of less than 0dbd (zero).
The modification may give you a slight (very slight) gain
over the 'stock' A99, but your gain figures are WAY off.
When talking about gain there are two comparisons, 'dbi',
and 'dbd'. 'dbi' means your comparing the antenna to an
isotropic antenna in free space. Basically, an isotropic
antenna is an imaginary one. 'dbd' means your comparing
the antenna to a 1/2 wave length dipole. The first, dbi,
is fine for computational comparisons, but does not always
'live-over' translating to the 'real world'.
Most CB antenna manufacuter's gain figures are false.
(Ham antenna manufacturer's too!)
'Doc

Daniel,
Whatta deal! You'll have to try the radio. May or may
not be any 'good'. Never seen a 9 foot base-loaded mobile
antenna. You sure thats what you have? If yes, then I'd
say it would be better than the other.
'Doc

"A. H." ,
If you have the choice, always connect the radio to
the battery, not the fuse panel inside the car. Use at
least a 14 ga. wire, bigger is better, and 10 ga. isn't
too large. The ground wire from the radio goes to the
(-) terminal, the 'hot' wire from the radio goes to the
(+) terminal. As far as making the physical connection,
that depends on what kind of battery, top terminal or
side terminal (or both). Use your imagination, but
simple is good.....
'Doc

349. Re: power question

Newsgroup: rec.radio.cb
Date: 2000-05-03 00:00:00 UTC

Source record: 34172

DukkhaKoti,
A second battery would work, and is fairly common. I would add a 'conditioner'/'regulater' between the two batteries (keep the second battery from discharging your primary battery). Also, Use the largest cable you can find ('0' welding cable isn't too large!). A long 'run' will use up more voltage than you'd think.
A second battery in the trunk should go inside a vented battery box. Run the vent to the outside of the trunk. Also, check the second battery often. Recharge/fill as needed.
Another way is to substitute a larger alternator. Not the 'cheapest' route, but may be cheaper than the second battery.

Toll Free:

Having lived in Flordia I beg to differ with you. While in High School a friend and I each got a Black Cat what was made by a friend of a friend who took parts home and was making them on the side. When the pre amp went out in mine, I located the address for repair. When I went to pick up the repaired unit they would not return it because they said it was stolen and had no serial number. That in turn prompted a call to one of my friends in the police department which in turn got the state attorneys office involved, in which the amp was subsequently returned.

Don't tell me the amp wasn't made in Florida...I lived there.

Is it possible it was a sateilite outfit?

362. Newbie Q: Station Numbers?

Newsgroup: rec.radio.cb
Date: 2000-05-04 00:00:00 UTC
From: Paul Olson <polson@ionet.net>
Message-ID: <8es034mo1@ionews.ionet.net>
Source record: 34111

It's been about 20 years since I used a CB (way back in the pre-40 channel days). I just bought another one and have listened in to comms in the upper/SSB channels and I noticed people using handles such as "440 Austin" in addition to a traditional handle. Where does the numerical designator come from? Is this a REACT member? Are the numbers just the whim of the operator? I'm assuming that the city is the location of the operator.

I've searched all over the Web for FAQ's that would answer this question, but have been unable to find one. Any help will be appreciated.

Paul

363. CB Radio Suppliers - Web Addresses

Newsgroup: rec.radio.cb
Date: 2000-05-04 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <iAfQ4.35752$Xk2.131410@tor-nn1.netcom.ca>
Source record: 34112

Hello there,

Sorry if this is an old question, but I am going to be getting into CB radio and wondered if anybody had a list of CB sellers on the web so that I can familiarize myself with the equipment and do some comparison shopping.

Thanks in advance,

Richard.

It was a repair job that I did. Then the fellow that owned it couldn't
pay for the repair bill saying that he had lost his job.
It has $100 in tubes in it ....all the tubes were spent.....supply bad
and then to boot , someone else got into it and wired it wrong ...so the

un doing of the wrong repairs was time consuming .
I am basically selling it for the repair bill.

Thunderbolt 305 10/11 meter tube amp.
Two stage : 1 6lq6 feeding 3 6lq6s.
3 watts drive gives 300 Watts into 50 ohm cantenna using a Bird 43
Wattmeter.
Asking $200 plus shipping. 30 pounds from zip 44128

Pic available.

Ron

You can join CB clubs that will assign you a number but I think that the number you referenced was a made up number that people commonily use. I use (297 Central Alabama).

In article <8es034mo1@ionews.ionet.net>,

paul its just another form of a made-up handle...there are some
clubs that issue numbers but there really isn't anything offical
about them....sometimes I use part of my phone number"743"

a few years back the FCC issued a statement that said if cb'er
wanted call signs they should use thier auto license plate
number. I didn't think that was a good idea as mine was "KG5XR"
and I didn't want to use that on the CB channels..

hi paul, things have come a long way in the last 20 years in free band radio. most of all the dx'ers your hearing belong to one radio group or another with a select few groups being more popular then others. the callsign system your hearing is a molested version of the ham dxcc for use on 11 meters. each country or radio entity considered as a country has been given its own prefix number (you can see the list here, all the groups us the same prefixes to make thing easier: http://home.t-online.de/home/IRDX.GERMANY/prefix~1.htm) when you hear a callsign like 2-IR-082 it is very easy to know where i am and what group i belong to and also my unit number in that group. the 2 stands for the usa, the IR stands for the international radio group i belong to, and the 082 is my unit number here in the usa for that group. if you hear 19-IR-082 it would be my friend mr wim from the netherlands as told by the 19 division prefix or 33-IR-082 would be a member in alska and so on and so on. it is very easy once you get the hang of it and have the dxcc list on hand. youll memorize them rather quickly. if you look at this url here you will see a small list of a few of the activations the IR club has done on 11 meters over the last couple years in some rare places, just remember these are only some of the places, the members have done even more exotic places recently but the site for those is still being built http://home.t-online.de/home/irdx.germany/irexp.htm good luck and feel free to email me with nay questions you have

Well, good DX was upon us again last night. From here in Arkansas I had contacts a few minutes apart with both the east coast and the west coast, as well as close contacts with Texas.

Nebraska, Iowa, Montana, Ohio, and other northern states I haven't heard in eternity were all coming in strong up past 10pm local time.

Hopefully the conditions will repeat themselves tonight.

patrick

The number "440" could be a shortened version of his call sign that was assigned by a radio club, much like mine is "2AR693", i could go by "693" if desired.

Or, the number could have just been a random number he pulled out of his head.

Generally a vertical antenna will need to be longer than a full
wavelength before it exhibits gain. Anything that a manufacturer says to
the contrary is pure hipe.

>>>>>>>>>>>><<<<<<<<<<<<
Well, there trying to reach mexico from NC also. They are about all I hear half the time, unless the locals here go to the pump. The Mexicans have pumps also, and they are using them. They go pay full retail at the radio shops for amps, radios with channels, sounds, etc. They love the woodpecker, roger beeps, and The good bad and the ugly tune. The kids at home run them when mom and dad aren't home. I wish they would go to those other channels so I could hear on the regular ones!

The gain of an antenna is closely related to its directivity. Because directivity is based solely on the shape of the directive pattern, it does not take into account any power losses that may occur in an actual antenna system. Inasmuch as vertical antennas are typically omnidirectional and rarely have nulls, how can a manufacturer (or you for that matter) in good conscience state that a 5/8 vertical antenna has anything close to 10 db gain? In terms of the actual physics involved, please explain how this could be possible? I fully understand that the manufacturers publish lavish claims in order to sell their products to the unsuspecting, but let's get real here.

415. FA: D104 / RFL1 Speech Processor Combo

Newsgroup: rec.radio.cb
Date: 2000-05-04 00:00:00 UTC
From: rev_lee@my-deja.com
Message-ID: <8eqvoarlp1@nnrp1.deja.com>
Source record: 34188

It did not sell last time but generated a lot of interest. Might even inspire you to build somthing like it. Everyone has a DX punching D104 in their shack! If you would like this special edition, one of a kind issue, DX puching RFL1 / D104 combo in your shack check it out. E-Bay item #324423329 . Auction ends 5/13/2000 at 19:56:50 PDT.

www.rfllabsinc.com

D104SP / RFL1 Speech Processor Commemorative combo issue. The combo is a TUP-D104SP microphone and a custom RFL1 Speech Processor mounted on a solid walnut base. The RFL1 Speech Processor is polished and engraved. There is an engraved name plate on the walnut base. The date engraved on the RFL1 Speech Processor and name plate is 3/15/2000. This is the official release date of the RFL1 Speech Processor. I am told that this is also the effective date of major FCC rules changes. The combo is fully functional, calibrated and wired for a 5 pin Cobra radio. Documentation is provided. This combo is rip your head off loud. Plug this into your peaked and tweeked 5 pin Cobra Radio and stand back. One tech note. The D104 is not noise cancelling so plan on using this monster in your quiet air conditioned pent house. Not in your diesel car! Money orders and cashiers checks are the only accepted payment method. Buyer pays actual shipping cost including customs costs. Shipping cost will be determined by location of buyer.
For more information and or specs please visit our web site.

i got some radio "stuff" that draws just enough amps to dim the headlights , and "steal" power from the engine . i have a small 4 cyl car . whats the easiest way to add more "power" ? (getting a new car is not an option)

i was thinking of running a second battery in the trunk from the alternator . and running my "stuff" off that . thinking that the extra battery will add more available amps . i am looking at this from a safty stand point ie: fire

Body handling: HTML body converted to readable text

Date: Thu,May 4, 2000, 12:28pm [ARRL_SB_SECTION] Fw: VIRUS info on "I LOVE YOU" attachment!!!!!! BEWARE!!!!

This press release comes from F-Secure. For more information on F-Secure's mailing list policy, see end of message.
F-SECURE WARNS: LOVE LETTER E-MAIL WORM might exceed Melissa in severity
ESPOO, Finland, May 4th, 2000 - F-Secure Corporation (formerly Data Fellows) [HEX: FSC], a leading provider of security for mobile, distributed
enterprises, is warning e-mail users of a new destructive e-mail worm called VBS/LoveLetter. This worm spreads by e-mailing a file called LOVE-LETTER-FOR-YOU.TXT.vbs around. F-Secure Anti-Virus detects and disinfects the virus, with the latest update available from www.F-Secure.com

"This worm spreads at an amazing speed", comments Mikko Hypponen, Manager of Anti-Virus Research at F-Secure Corporation. "We got the first report around 9:00 a.m. on Thursday from Norway, and by 1 p.m. we had reports from
over 20 countries. We estimate that total number of infected machines is already in tens of thousands. This epidemic might exceed Melissa in both speed and destructiveness."
The LoveLetter worm activates by overwriting picture and music files from the local and network drives. Files with extension JPG, JPEG, MP3 and MP2 are overwritten and will have to be restored from backups.
The worm arrives to users in e-mail message attachments called LOVE-LETTER-FOR-YOU.TXT.vbs. On a default Windows system, the ".vbs" extension is not visible, and users might mistake the file for a harmless text file (.TXT). If the recipient opens the attachment, the worm will use
Microsoft Outlook (if installed) to send a message to everyone in any address books (including global access books of the organization these typically contains hundreds or thousands of addresses). The messages is as
follows:
From:
Name-of-the-infected-user
To:
Random-name-from-the-address-book
Subject: ILOVEYOU
kindly check the attached LOVELETTER
coming from me.
Attachment: LOVE-LETTER-FOR-YOU.TXT.vbs
As address books typically contain group addresses, the result of

executing
the VBS/LoveLetter worm inside an organization is that the first
infected user sends the message to everybody in the organization. After
this, other
users open the message and send the message again to everyone else. This
quickly overloads e-mail servers.
In addition to spreading over e-mail, the worm also overwrites existing
local script and HTML files with its own code.
The worm was most likely written in the Philippines. It was first
spotted in early morning, Thursday May 4. It contains the following
text:
barok -loveletter(vbe) by: spyder / ispyder@mail.com / @GRAMMERSoft
Group / Manila,Philippines
VBS/LoveLetter is written in the VBScript language. By default, programs
written in VBScript operate only under Windows 98 and Windows 2000.
However, Windows 95 and NT 4 users are also vulnerable, if they have
installed version 5 of Microsoft Internet Explorer.
A technical description of the virus is available in the F-Secure virus
description database at: http://www.F-Secure.com/v-descs/love.htm
Sample pictures of e-mail messages generated by VBS/LoveLetter are
available in the F-Secure virus screenshots center at:
http://www.F-Secure.com/virus-info/v-pics/
About F-Secure Corporation
F-Secure Corporation is a leading developer of centrally managed
security solutions for the mobile, distributed enterprise. The company
offers a full
range of award-winning integrated anti-virus, file encryption,
distributed
firewall and VPN solutions. F-Secure products and the underlying policy
management framework enable corporate IT departments as well as service
providers to deliver Security as a Service(tm). For the end-user,
Security
as a Service is invisible, automatic, reliable, always-on, and
up-to-date.
For the administrator, Security as a Service means policy-based
management,
instant alerts, and centralized management of a widely-distributed user
base.
Founded in 1988, F-Secure is listed on the Helsinki Stock Exchange [HEX:
FSC]. The company is headquartered in Espoo, Finland with North American
headquarters in San Jose, California, as well as offices in Canada,
China (Hong Kong and Beijing), France, Germany, Japan, Sweden and the
United Kingdom. F-Secure is supported by a network of VARs and
Distributors in over 90 countries around the globe.

Personally, I would use a 1 farad cap, inserted as close to the "stuff" as I can get it. It's an audio amp trick I used in my car to keep the bass "bump" from drawing too much from the battery, and killing the alternator, and it should help with the dimming problem as well. A larger amperage alternator wouldn't hurt, either, nor would a second battery. All three would definitely, if properly wired in, fix the problem.

You can get these 1 farad capacitors from most "elite" mobile audio shops.

Hope this helps.

My personal favorite for a pickup is a steel toolbox mounted all the way
forward in the bed.
Make sure that puppy is grounded, then install a ballmount right in the
center of the lid.
Then you can put any good center loaded or straight whip on there, and it
should do exactly what you want.
Good luck... :)

> May be out of context but......does anyone know the freq's that are
> classified "marine band"?
> ken
>

Marine frequencies were assigned in harmonic relationship in the same manner as the original amateur bands. Marine activity will take place in these ranges. BTW AM has not been legal since 1972.

600 Meters. 500 khz is the ancient and honorable SOS freq.
150 meters including the Coast Guard calling freq at 2182 khz
75 meters. A lot of Alaskan activity is at 4+ mhz
50 meters. At one time, pretty popular CW freqs
37.5 meters around 8200, probably pretty popular these days
25 meters around 12
probably more at about 16, 20, and 24 Mhz

With the advent of FM, all boaters with any radio must have this first before an HF license will be issued. Calling freq (channel 16) is 156.8. If any range is "marine band" it is this one.

people on these freqs are surly beyond belief to unauthorized or illegal users. Riley is a cupcake next to the grumpitude a bootlegger will be shown at your local marina.

Enough to get you started.

Who is a good reliable source to purchase parts (like finals, etc)...
RF Parts is good, but they charge too much for shipping and have a
$25.00 minimum...

Thanks

A.H.
Use RG-8 coax from battery to radio. Center conductor + and
shield to ground. Less loss and cuts down on noise input to radio.

Good evening Tim

I note your comments and find them somewhat bewildering. My
message was posted on May 2 at 1.44pm. The first reply I
received regarding it was yours on may 4 at 6.55am. Now the
reason I did not receive any flak from my comments is pure
speculation, however, I figure that most people where smart
enough to see that what I quoted was not snipe at your second

amendment or gun laws, it was to HIGHLIGHT the FRUSRATIONS that a great deal of the CBers in your country feel at the obstacles that are placed in front of their hobby/living as opposed to other pastimes.

>hi mickey. lets not alk about guns here.

Now to compound the felony, you ask me not to talk about guns because it is your right to carry a gun and nobody is going to take that away from you.

Well thats fine with me, however, by asking me not to talk about a subject on the NG, arent you technically violating your first amendment, freedom of speech. (Well I think its the first)

I have every sympathy with CBers, I am one myself, I dont think they should hang a man because his rig deviates 5 KCs higher or lower than is legal but compared to the UK you are pretty damn lucky, we have 80 channels FM and thats it, no AM and definitely no SSB.

>
>after all the USA citizens were given the right to have arms to protect us from
>our own government if need be. do you guys have the same capabilities over
>there with your billy clubs and pepper spray?

Well Tim I was a keen shooter until a couple of incidents that happened here in the UK, do you remember the Dunblane massacre in Scotland. As a result of that incident ALL handguns over .22 calibre where recalled. It is virtually impossible to obtain a licence for a handgun in this country. The funny thing is, six or seven years on from the tragedy I would say that 99% of people now accept it and handguns are not much of an issue here anymore.

Best wishes
Mickey

In the good ol' days, there WAS something specifically called
"Marine Band" and often referred to simply as "the M.B."
I believe those freqs fell in the range of about 1.2 to 1.6MHz,
but it may have been more around 10 to 12MHZ. I had a receiver
for that band one........

Today's nautical frequencies typically are around 158 to 162MHz,
I believe they are all FM now.

Greetings!

If you're going to use the battery, you'll need two fuses, one from the battery Positive [+], and one past the firewall at the radios own positive lead for protection. If a short were to occur, the wire in the engine compartment is not protected and can cause a fire. The fuse on the other end protects the radio in case of polarity reversal.

You can get by with one, but make sure you have it for the engine compartment side protecting the wire if it ever shorts.

Never fuse higher than the maximum rated current for the AWG of wire you plan to use.

There are reasons why I don't recommend this until you've done some checking into this type of wiring versus simple fuse panel hookup.

If the vehicle or the battery is still under warranty and needs service, the dealer/shop can refuse to honor the warranty. This is especially true with insurance coverage issues.

Check with your owners manual and any implied warranty
or other coverage first.

Remember that this type of connection made for the radio, you have bypassed the vehicles main fuse block and any electrical protection it can provide.

On Wed, 03 May 2000 23:48:33 -0500, while the modem was pondering it's navel, "A. H." <a0h9065@labs.tamu.edu> dissertated the following:

What is the general consensus about www.exportradios.com are these guys good ones to buy from? I am going to buy a galaxy 77hml (thanks to the helping suggestions of the people of rec.radio.cb) and I was looking there and www.coaxkid.com and didn't know who was better. I ordered some stuff from left coast a while a go and was very impressed with them. Also exportradios says that they convert all the galaxies before they ship them, does anyone know if leftcoast does that? Also does anyone know what the galaxy 77hml dead keys and swings on the high medium and low settings. I think I will have to run it on low if I feed it to an amp but I don't know the numbers.

Trying to get a foot in the door and have
some good sounding long distance
fun in this great hobby

Now I will shutup, listen, and hopefully learn.

Boswell.....

Hamm4fun:

Ok.. I suppose I can try the microwave test on the PVC I have. I've heard that certain types of PVC have a copper-based compound in them, which causes this loss, and other types do not. I'm not sure which I have on the truck, but I'll check with a bit of the spare that wasn't used, and I'll be sure to put the water in there for my coffee in the morning. ::grin::

As for fiberglass... any idea where I can get a 4-5 foot length of it with a 3/4 inch outside diameter? I'm willing to try it out, but with the same dimensions as my current antenna, so I can do the wraps the same distance, etc. Of course, now I have the problem of mounting the whips , but I'm sure I'll be able to figure something out.

Thanks again for the pointers. Maybe I'll be able to make that 12 watts scream louder...

-CGP
-151 on SSB 27.385

CD,

When I owned Fords (long time ago), I had a devil of a time getting the ignition noise out of them! We used to say while listening to an AM radio and it would start buzzing, "There comes a Ford". Why, you couldn't sneak up on anybody! LOL! And when my last one kept leaving me stranded, THAT'S when I stopped trying to "reason" with 'em! LOL! Went to Chevrolet in 1973. Not only were they more reliable, they were much quieter radio-wise and didn't seem to mind having a few radios in 'em. These days, CD, I have to agree with you on the computer thing. I have never had any trouble with radios/amps in a Chevy. My old Celebrity has 190,000 miles on it, I drive it every day, and enjoy my radio hobby from it. The HF radio is an Icom 706 coupled to a Messenger M4V as well as 2 meter and commercial VHF stuff installed as well. The old "feller" never even stutters.

Gee,
What did I say to set you off? I said I was joking, OK? But I will answer your question as regards the Messenger. Running conservatively at about 350-400 watts with 5 watts drive, it's about 80 amps, give or take a little. BUT I do this by not running A/C, car radio, or other accessories when using the radio. I DO plan to upgrade the alt at some future time, but since the thing does work, I'm not in a hurry about it. You can really SEE the amp gauge deflect on it, and I guess I am lucky to have a factory 100 amp alt--some people have 75-80. A little more "reserve" wouldn't hurt. ....I still don't know what I said to piss you off.

Jason, I think you will find that all of the major dealer's on the net, have good reputation's that they aim to keep, by providing good service to all, every business at one time or another goofs up, or possibly cant fill an order,its how they handle those times,that seems to impact their public the most, asking which is best is a bit of what we on this NG call a TROLL thread, you should look at all of their pages, compare price's, and location's via shipping costs,and also compare if that new radio is ready to put on the air or if it needs to have additional mods done to it. Hope this helps you, 73's

I'm beginning to believe they don't MAKE a manual for that amp. LOL!
But what the hey, I only paid $200 for it. Saw one on Ebay for twice
that.

Two weeks ago I bought a RCI 2950 a Palomar Magnum 4500 amd and a wilson 1000 from exportradios.com.....I am very happy with the results. This past Monday I ordered the Palomar 225 (for my wifes car) from Left Coast Radio (coax kid) and got it today...so both places delivered what was promised. I liked the way I was they treated me at exportradios...and would buy from them again...on the other hand Left Coast has better prices pn stuff...either one you cannot go wrong in my book...FWISW

I have a chance to buy a Galaxy DX88 that peaks close to 60 for
$250.

Or I can buy a Connex 4800 for $225.

Both radios are without box and manual but both will be tweaked
and peaked by the shop technication

Both radios are basically new.

Which one? Or either one? Good deal? Bad deal? Openions please.

First of all, why do they have to be peaked? I have a 88 and when I got it,
it did 40W on AM, and 70W on SSB and 110% modulation without a screwdriver
being in it. The 88 is a good radio, but watch out for cold solder joints.
I have had to resolder at least 6 different joints. The 88 have a bad swing.
I got mine to dead key 2W and swings up to 40W.
I don't know about the Connex, I think it is a great one too.

Below is a response I posted the other day. Today I discussed it with my brother and we are both intrigued (especially him because he still is fond of demonic linear amplifiers and hellicious illegally modified radios) about the possibility of what I described below being true.

Did the radio/amp factor in to the car stereo's demise?

Could we get some expert opinions please?

The radio used was just a PC66XL but it was peaked and clipped, no fancy mics or noises were in it.

THANKS!!!!

>

My first car was an '88 Chevy Celebrity Eurosport sedan, this is back in 1990 when I got it used from my parents. I used to be into the linears back then, I believe I had a Texas Star 667 in the car (went to CAP and bought a high-amp alternator to replace the stock one) and within two days of putting in the amp (I would use the CB/amp maybe three hours a day) I had completely "fried" the car's stock stereo system, it only received the strongest FM and AM stations and the cassette player did not work at all anymore. My parents had rarely used the stereo so it's not like it was worn out......

Thanks guys, that's a little overwhelming that my informal review (did you check the spelling before displaying it?!?!) is in some stores.
Glad to hear it, stuff like this ought to happen more often. I mean, it's not the best antenna out there for all situations, but with encouragement, new designs and concepts will be better moneymakers AND help out radio hobbyists in mildly dire antenna straits. Situations like that can only make future product (particularly product based on newer designs) more appealing to manufacturers AND the public, which is a boon to all of us financially and performance-wise.
That's very kind fellas. Thanks again!
Linus

496. FS: CB Base Antennas For Limited Space Applications

Newsgroup: rec.radio.cb
Date: 2000-05-05 00:00:00 UTC
From: antenna_warehouse@my-deja.com
Message-ID: <8etdosjbo1@nnrp1.deja.com>
Source record: 34219

Hello,

I have 3 different antennas for those who are in situations that don't allow for big outdoor base antennas. They can be seen at the eBay Dutch auctions below.

INDOOR BASE CB ANTENNAS $15.00
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=322076040

NO GROUND BASE/MOBILE CB ANTENNA $29.95
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=322049372

BALCONY/WINDOW/ROOF MOUNT CB ANTENNAS $37.95
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=322057224

These are being sold in a Dutch auction, which means no worries about being outbid at the last moment, or the price sky rocketing because of bidding wars. You bid, you pay, you get one! If you don't want to go the eBay route, no problem! Contact me direct.

Be sure to check our other auctions and website for other great deals on Scanner, CB, and Amateur antennas.

Thank you

AntennaWareHouse

Thanks for the suggestions.
1 question when tunining the antenna would the height of the mount
(which by the way is just wood)make a difference.?

015 Radio Canada.

tell you the truth if tuning the antenna doesn't mean match it up with a
SWR then I really haven't tuned antenna. Have you any info on this
topic. Including the radials as well

It would be very greatly appreciated.

Lift up the hood and see what's inside. You could find out the manufacturer easily enough, assuming they used the number 1945 and it wasn't the build date. That doesn't mean getting technical information is either easy or advisable. If this unit is recent there is a possibility that it has going AWOL. Requesting information from the manufacturer could cause some grief (happened nearby a couple of years ago).

Gives us some idea of how much current you are drawing, the battery
capacity (minutes of reserve) and the output of the alternator. Armed
with this information, I can give some more meaningful recommendations.
Sometimes there is a 50 cent cure for what appears to be a $100 problem.

There are sacrificial interstage resistors that should be
checked if the output is low.

And yes, both amps should test the same if they are both
tested using the same test set-up.

Those caps are no substitute for a real alternator! They only work in the audio world because the drain there is only on momentary bass peaks. They will do nothing for you on AM or FM with your amp. They may have a slight effect on keeping your power peaks up on SSB...

That is terrible efficiency! Let's work out the numbers. 80A x 14V= 1120W coming from battery
400W/1120W= 0.35 or 35%
That means that only 3.5W out of every 10 are leaving the amp and going into the antenna. The other 6.5W go into heating the heat sink of the amp. That must be one hot mother!

That's pretty funny.. a virus detection software company putting out a "press release" saying that a new virus is out and their software will protect you.. is that some marketing ploy or what!?

We all know you can't get a virus just by reading email. You would have to download an attachment, such as a program, and RUN it.. you can safely have an infected program on your hard drive and never affect your system if you don't run the virus.. it's not like an actual living, biological thing...

This is just another rumor. I'm just suprised that they didn't throw in that it's "more dangerous than the Mellisa virus".. that's usually in the emails that say "Don't open email with the name..."

Try this link for any military gear info:

http://www.telalink.net/~badger/millist/mi.html

The info below came from this site under BC-604.
There is also a schematic available for view or capture from this link

Hope this helps,

David

****

BC-604
Transmitter, 20-28MHz, FM, 20 Watts, 10 crystal channels, 8 tubes, Part of

Well, your points are well taken but it's not 'just a rumor'. You're right in
that one simply shouldn't DL an executable file from someone they don't know.
One DOES have to DL it and run it to get 'sick'... But it's not at all a hoax
or rumor, I've seen three friends (idiots, most of them, it seems!) lose their
Netscape or have all of their saved jpg and mp3 files tuned into unusable
'.vbs' files.

No, you don't have to download just to get a virus. Some viruses are attached to the email it's self. Once you open that email to read it, it is in your system, trust me, I know how this crap works. I study viruses. This is not a rumor, my best friend who works for a brodcast AM station got over 2 thousand of these emails. He showed them to me.

Message-ID: <391305E1.578047C2@bellatlantic.net>
Source record: 34319

I have a Rci-2950 that has a bit of trouble..Can anyone help?

The radio did not transmit or receive....
I found that the problem was the 7805 Regulator on the main board....
I replaced it and the radio works great, however the regulator gets so
hot you could burn your finger on it...
I put a heatsink on it, but it still gets very hot...

Could someone tell me why this is getting so hot and how to fix it...

Thanks
Steve

Both are great antennas. If you can afford it though, get a 5/8 wave antenna. They have a lower radiation angle than the 1/2 waves. There's nothing wrong with the 1/2 waves, but the 5/8 wave is just a better antenna. But, the main thing is that you must have your antenna at least 1 wavelength (about 35 ft) in the air at least, and make sure that it is well grounded. I might be telling you something that you already know, but if not I hope it helps. Good luck.

I also had some good contacts last night talking DX in my pickup. I talked with 465 in Jackson, Mississippi and he was coming in loud and clear here in Wichita, Kansas. I was mainly hearing people in Mississippi, Alabama, the Carolinas and Arkansas. I hope that the DX'ing is as good tonight.

The cap will only help a little, an extra battery will work your alternator harder, the cap will cost you half as much as a good alternator. I would upgrade the wire from the alt to the battery, also do this with a wire going to ground from the battery to the frame, the factory ground wire is going to the block for the starter, leave it, but add at least a #4 wire from battery to the frame, bolt it good and clean the paint. This will allow you to truly use the frame for a common ground point, don't run a ground directly to the battery from the amp, go to the frame, this will make for a better bond throughout the vehicle. On the positive run at least a #4 wire to the amp and fuse it as close to the battery as possible, if your amp "draws" say a hundred amps, fuse the wire at 150 amps, this will keep the voltage drop to a minimum and this fuse will still keep a fire from happening in a short circuit situation, but be sure you fuse it at the battery, the fuse is not to protect the amp but more importantly, the vehicle and the passengers inside.

the one ferret cap is a good idea .

wish i could build up the alternator , but its allready at max safe output .

on AM the "peak draw" isn't really a problem .barely a dim . but on SSB it is very noticable .

it draws 45 amps . and its a diehard battery , alternator is at 110 , but the car uses 90 . and i have about 10-20 amps of extra crap drawing including the radio . i am getting #4 wire tonight , thats a good idea . so from what you said , the cap and the new wire should solve the problem since its not a real big one to begin with

thanks alot

Date: 2000-05-05 00:00:00 UTC
From: "D.K.W." <crylo@swbell.net>
Message-ID: <39134397.ED65A6A7@swbell.net>
Source record: 34348

Here are the instructions for removing the HAPPY99.EXE virus if anyone happened to pick it up from my post. I hope that nobody did, but it is very easy to remove. Once again, I am sorry for posting this virus, it was not intentional.

Rocketman "822" in Wichita, KS

Removal Instructions
Use specified engine and DAT files for detection. Removal requires manual operation: You will need to reboot to MS-DOS mode as WSOCK32.DLL cannot be changed under Windows. "SHUTDOWN | RESTART TO MSDOS MODE" and when at the command prompt, type in these instructions:

```
CD C:\WINDOWS\SYSTEM
REN WSOCK32.DLL WSOCK32.BAD
REN WSOCK32.SKA WSOCK32.DLL
DEL SKA.EXE
DEL SKA.DLL
COPY LISTE.SKA C:\
```

The above is sufficient to stop the worm from working. To restart Windows, type EXIT. Note that the file LISTE.SKA contains a listing of persons whom have received the HAPPY99.EXE file unsolicited from you. It would be good netiquette to inform them of this misdeed and forward them the removal instructions as well.

So? What's the big deal? No flames, but I am not TRYING to have a KW mobile. And it may not even draw that much the way I run it. All I want is just enough power to be heard in the rare DX pileups. All that's needed is enough power to establish and maintain communications in accordance with good operating practice. Can I get more out of the amp? Sure, but if it works well the way it is, why do it? The most I have ever seen is 670 watts on 75 meters (peak SSB), and, no, it doesn't run hot> So I run just enough drive to get 300-500 watts PEP out, the car handles the drain fine, and I don't sweat the details as long as everything is working as it should. Flame away if you guys like, doesn't bother me a bit.

If it has the standard Pearce-Simpson 2 pin plug check your local truck stop or Radio Shack. They are still a pretty common item. I have bought several for my Royces and Pearce-Simpsons. Good luck

I would recommend either the Cobra 29 Classic or a Uniden 66XL, 76XL or 78XL. They are great radios and not that expensive. In my opinion, stay away from the Cobra Soundtrackers though. They cost more and they aren't as good as the Cobra 29 Classic

Kill them all, let GOD sort them out!

What a freakin hypocrite you are Jerry. Why just last month you were spouting off about your flying days and bitching about how the "rules are for everybody" and rant and raved about freebanding, amplifiers and modded radios.Now here you are playing with an amp. Then you ask over and over for noone to flame you in alot of posts. Should I bring up the posts you self serving hypocrite? Your kind is the worst.

Well, in theory, dual antennas cophased will make your vehicle bi-directional (more power to front and back and less to the sides). The only problem with this is that your antennas are supposed to be a 1/2 wavelength apart for this to work properly. Well, there is no way to put your antennas 17&1/2 ft. apart on a vehicle. So, actually, cophasing on a vehicle helps a little bit, but the result is minimal.

OK, I'll try to tell you a couple things I can do with ham radios that cost WAY less than $1000. On two meters, I can make outgoing phone calls using something called AutoPatch. Not all repeaters have patches, but lots do, and rather than paying for cellular service, I can call home, call my YL, call the cops if I need to, or order a Pizza. And some of that is with a 2M handheld that cost me about $200. Using those same repeaters, I can talk as far as 100 miles out on it. There is a repeater on Mt. Mitchell, NC that I can hit with that little pocket rig where I can talk to middle Tennessee, Georgia, Virginia, SC, and as far north as Kentucky from my home here in NC. Ya see, I don't need a cell phone, rarely make any calls from the car, but if I have an emergency, or just need to call home for a minute, it is all I need. Most repeaters are open, free to use, and quite reliable. The ones that are controlled by a tone, most fellows will be glad to press the access tone and let you talk. I have less than $400 dollars in 3 VHF ham radios. VHF offers quiet FM operation or SSB, and other modes that are interesting.

I was at a hamfest last weekend and an acquaintance had an Icom 706MKII for sale for $650. This little rig offers operation on every ham band between 1.8 and 54 MHZ, plus aircraft receive, general HF receive coverage, 2 Meters, AND VHF commercial bands up to 200 MHZ (sensitivity drops off up there), AND it is a scanner. It offers SSB, upper and lower, CW, AM, FM, wide and narrow, relay key for amps, it is remotable to hide it from prying eyes and sticky fingers, and it is no bigger than many of the CB radios. Oh, I also saw an IC706MKIIG (the latest version) for 950 bucks which has improved features and the UHF bands (70CM). But then, that's what hamfests are about--at least to me. You can find like new, used equipment for much less than $1000--all of which will generally offer many more frequencies, many more features than Most CB rigs at quite reasonable prices. But, again, one must have that ham ticket to use it, and that is NO obstacle anymore. I know some will spew forth hate and flames for this post, but I did not mean it do that. Just trying to point out that ham radios don't cost all THAT much, and IMHO, are really the better bargain--especially used and if they are IGC.

Best 73

Jerry

Source record: 34418

OK! YOU ASKED FOR THIS! I TRY TO BE NICE, BUT SOME PEOPLE JUST CANNOT DISAGREE WITHOUT STARTING STUFF. FIRST OF ALL, MR. KNOW-IT-ALL, I HAVE CLEARLY STATED THAT I AM A HAM AND A CBER AS WELL. I HAVE A LICENSE TO OPERATE LINEAR AMPLIFIERS UP TO 1500 WATTS IF NECESSARY TO ESTABLISH AND MAINTAIN COMMUNICATIONS. IN ALL, OR MOST, OF MY POSTS, I HAVE NOT HID-EN THE FACT THAT I AM A HAM, NOR HAVE I COME OFF WITH A SMART ALECK ATTITUDE. THE THING YOU CAN'T SEEM TO GET THRU YOUR HEAD IS THAT WHAT I DO IS LEGAL, AND IF YOU DO NOT HAVE THE REQUIRED LICENSE, IT IS NOT LEGAL. WHETHER YOU CARE ABOUT THAT IS YOUR OWN BUSINESS--I DON'T GIVE A DAMN WHAT YOU DO. I CAN G0 OUTSIDE, OR CALL UNCLE CHARLIE AND TELL 'EM I HAVE A 500 WATT AMP IN USE. AS LONG AS THAT AMP IS CLEAN, STAYS WITHIN THE REQUIRED BANDWIDTH, OLD RILEY H. IS GONNA REPLY, "SO"? IF YOU DO IT WITHOUT THAT LICENSE--WELL, YOU WOULD REGRET TALKING ABOUT IT. I DIDN'T MAKE THE RULES, BUD, I JUST FOLLOW THEM. WHEN I GET ON CB, I USE A LITTLE RADIO SHACK 6 CHANNEL 4 WATT RADIO. THAT'S LEGAL, TOO. WHAT YOU DO AND I DO ARE TWO DIFFERENT HORSES. YES, I RUN AN AMP, BUT YOU'D BE SURPRISED HOW LITTLE IT REALLY GETS USED. IF I AM CHASING A RARE STATION IN A PILEUP, THEN IT COMES ON. OTHERWISE, IT'S OFF. I KNOW IT MUST GALL THE HELL OUT OF YOU THAT WE BOTH CAN BE DOING THE SAME THING AND YOU CAN GET BUSTED AND I WON'T. YOU WON'T FIND ME TALKING ON THOSE SO-CALLED 'FREEBANDS", EITHER. IT IS OFF-LIMITS AND IT'S PEOPLE LIKE YOU THAT COME ON HERE TRYING TO STIR UP CRAP THAT MAKES ME TEMPTED TO LAUGH WHEN ONE OF YOUR OUTLAW FRIENDS GETS NAILED FOR 10,000 BUCKS FOR UNLICENSED OPERATION UP THERE. I HAVE TRIED TO BE NICE, TRIED TO HAVE MATURE DISCUSSIONS, AND DISAGREE IN A NICE WAY IF NEED BE. BUT SOME PEOPLE LIKE YOU, SIR(?), WITH YOUR FLAMES AND RAPPA ATTITUDE MAKE THAT IMPOSSIBLE. GO BACK UP ON CHANNEL 6, CRANK UP YOUR AMP, FRY YOUR LITTLE PEA BRAIN AND HAVE FUN WHILE YOUR AT IT. IT IS NOT MY FAULT THAT YOU CANNOT READ, CANNOT INTERPRET WHAT YOU DO READ, AND CANNOT STAND IT WHEN PEOPLE EARN PRIVILEGES YOU DO NOT HAVE--BUT THAT'S THE WAY IT IS IN THIS WELFARE STATE OF OURS, RIGHT? GET EVERYTHING FOR NOTHING. I AM. SO I DESERVE, RIGHT? WRONG!!!!!!!!! TO INTERPRET WHAT YOU READ FOR YOU: I DO NOT USE A LINEAR AMP ON CB!!! NOW, DO YOU UNDERSTAND IT?

Guys, I'm sorry I lost my temper, but this guy is a putz. This is not meant as a put-down to 11 meters or the guys that enjoy it, but is aimed solely at the guy that addressed me as a hypocrite when he has not a clue as to the intent and content of the posts he referred to.

Nah, its probably all the criminal freebanders running high power with
dirty amps.

Why would you hide or evade the goverment because of him? That
make no sense at all. If you weren't into criminal activities, you
wouldn't have to hide at all.

604. 200+ Watt Exports Some questions

Newsgroup: rec.radio.cb
Date: 2000-05-05 00:00:00 UTC
From: Redwire <graydogsNOgrSPAM@yahoo.com.invalid>
Message-ID: <04bd5b9a.fea66e2b@usw-ex0104-028.remarq.com>
Source record: 34427

Has anyone tried the Ranger 6900F Turbo which is suppose to have an output of 225 watts? Is that its peak output or is that its sustained output? (is the term RMS used with CBs?)

What about the RCI General Grant which is suppose to have an output of 200 watts? Same question as above.

What are some of the other Exports that put out more than 175 watts?

If I wanted to go for power in a Big Radio without using an external amp what should I look at?

Thanks in advance.

Yeh, I read about the dB gains that they were reporting. They were reporting their gain in the form of "dBi" instead of "dBd". I think that they have corrected it though, but the article I read said that the retailers are still using the old info to sell the antennas. However, the Shakespeare is still a great antenna regardless of what they say their dB gain is.

606. Antenna evaluation

Newsgroup: rec.radio.cb
Date: 2000-05-05 00:00:00 UTC
From: Maveric <maveric169@hotmail.com>
Message-ID: <8f06gs$88i$1@slb6.atl.mindspring.net>
Source record: 34429

The overall length is about 6 feet. It's center loaded. The bandwidth is about 120 channels. 40 up and 40 down on the CB band. I can get it tuned for a different band. The power capabilities is 10KW +.
The whole setup (mount, spring, and antenna) is about $170 below is a link to the pic of it. Let me know what you all think. The antenna is fully customizable.
Would you make any changes? If so what would you change and why?

Source record: 34430

I've looked in the ARRL Handbook. I've searched on web pages
dealing with the subject. I can't seem to find an answer.

What does the third number in a SWR reading stand for?

Is 1.5:1 different from 1.5?

Even a few "advanced" articles I read regarding SWR simply
skipped over this subject....yet used three numeral examples
without saying what the third numeral after the colon
represented.

Yep!!!! Most use DBi and their figures were too far out to
lunch like most manufactures. Never the less I am use to the
Starduster for 10 years and the 1600 blows that away.

I never take the manufactures gain figures to seriously
until I see or hear at least a couple of good testimonies
from owners.
Cheers,
John

I'm surprised that eBay is actually enforcing the ban against CB amplifiers now. For months, I found it quite ironic that they would allow sales of linears in the "CB" category, yet not allow sales of cellular-capable scanners.

If you want to buy a new one, the Maco 5/8 wave wins hands-down over anything else currently on the market.

If you're willing to do some searching of rooftops and knocking on doors, the Hy-Gain Super Penetrator 500 is the best omni antenna ever made. Look for cut or broken coaxes, hanging and flapping in the wind. Sure signs that the antenna hasn't been used in years. The owner would probably sell it cheap...or maybe even pay you a few bucks to get it off their roof!

Yes, you are overlooking something real simple, but this isn't a physics or math class, so I would recommend that you take a look at the ARRL Handbook--it explains this in intense detail. Essentially you are looking at the relationship between the reflected power and the forward power which is not reflected. Non reflected power in free space has a value of one. A perfectly resonant antenna with no reflectivity would indicate a vswr of 1:1. As the level of reflectivity increases, the first value increases until it reaches infinity. For your purposes you need to keep the vswr to 2:1 or less.

And you should also note that an antenna is only resonant at one single frequency. Attaining a perfect match across an entire band or bands is virtually impossible. My rule of thumb is to attempt to keep the output match of the antenna to 1:1.7 or less. Improving on this figure is only really necessary when extreme power... say 50KW is being delivered to a load. At these levels... even a 5% reflection can mean a lot of watts being dissipated in the amp!

GET $40,000 WITH ONLY 6 BUCKS!!! THIS IS NOT A SCAM!!!

A while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of CASH within weeks with only an initial investment of $6.00 plus stamps! So I thought, "Yeah, right, this must be a scam!" But like most of us I was curious and kept reading. It said that if you send $1.00 to each of the 6 names and addresses listed in the article, you could make thousands in a very short period of time. You then place your own name and address at the bottom of the list at #6, and post the article to at least 300 newsgroups. (There are about 32,000 of them out there and that's quite a large market pool). No catch, that was it. Even though the investment was a measly $6, I had three questions that needed to be answered before I could get involved in this sort of thing.

1. IS THIS REALLY LEGAL?
I called a lawyer first. The lawyer was a little sceptical that I would actually make any CASH but he said it WAS LEGAL if I wanted to try it. I told him it sounded a lot like a chain letter but the details of the system (SEE BELOW) actually made it a legitimate legal business.

2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD?
I called them: 1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18, h sections1302 NS 1341 of Postal Lottery Laws). This clarifies the program of collecting names and addresses for a mailing list.

3. IS IT RIGHT?
Well, everyone who sends me a buck has a good chance of getting A LOT of CASH ... a much better chance than buying a lottery ticket!!!

So, having these questions answered, I invested EXACTLY $7.92 ... six $1.00 bills and six 32 cent postage stamps ... and boy am I glad I did!!! Within 7 days, I started getting CASH in the mail! I was shocked! I figured it would end soon and didn't give it another thought. But the CASH continued coming in. In my first week I made between $20 to $30. By the end of the second week I had a made a total of $1,000.00. In the third week I had over $10,000.00 and it was still growing. This is now my fourth week and I have made a total of just over $42,000 and it's still coming in ..... It's certainly worth $6.00 and 6 stamps !!!

Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you

follow the directions exactly, that you will start making more CASH than you thought possible by doing something so easy!

Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the CASH come in! It's easy. It's legal. And, your investment is only $6.00 (Plus postage)

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE:
Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. THIS PROGRAM REMAINS SUCCESSFUL BECAUSE OF THE HONESTY AND INTEGRITY OF THE PARTICIPANTS. PLEASE CONTINUE ITS SUCCESS BY CAREFULLY ADHERING TO THE INSTRUCTIONS. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the CASH made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list.

Here are the 4 easy steps to success:
STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses:

#1) Christopher L. Sloan
2200 Hickory St.
H.S.U. Box #14579
Abilene, TX 79698

#2) Kristen DeJoseph
138 Jansen Street
Staten Island, NY 10312

#3) Baraquin Yannick
10 Charlemagne
L-1328 Luxemburg

Luxemburg

#4) Fco Javier A.
107 ote Matancillas
Garza Garcia NL
Mexico 66230

#5) A. Hutasuhut
312 College Avenue
Apt. #414
Ithaca, NY 14850

#6) K. Hochburger
351 Hardin Bridge Road
Kingston, GA. 30145

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 300 newsgroups. (I think there are close to 32,000 groups) All you need is 300, but remember, the more you post, the more CASH you make! This is perfectly legal! If you have any doubts, refer to 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need CASH, you can use it again, and again.

PLEASE REMEMBER THAT THIS PROGRAM REMAINS SUCCESSFUL BECAUSE OF THE HONESTY AND INTEGRITY OF THE PARTICIPANTS AND BY THEIR CAREFULLY ADHERING TO THE DIRECTIONS. Look at it this way. If you are a person of integrity, the program will continue and the CASH that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a VERY GOOD idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of CASH in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business!

---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS

Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this letter, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.

Step 2) Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.

Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you'll always have this file to go back to.

Step 4) Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.)

Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 300

That's it! You will begin receiving CASH from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part:
Out of 300 postings, say I receive only 7 replies (a very low example). So then I made $7.00 with my name at #6 on the letter. Now, each of the 7 persons who just sent me $1.00 make the MINIMUM 300 postings, each with my name at #5 and only 7 persons respond to each of the 7 original 7, that is another $49.00 for me, now those 49 each make 300 MINIMUM posts with my name at #4 and only 7 replies each, I will bring in an additional $343.00! Now, those 343 persons turn around and post the MINIMUM 300 with my name at #3 and only receive 7 replies each, I will make an additional $2401.00! OK, now here is the fun part, each of those 2401 persons post a MINIMUM 300 letters with my name at #2 and they each only receive 7 replies, that just made me $16,807.00!!! Those 16807 persons will all deliver this message to 300 newsgroups with my name at #1 and if still 7 persons per 300 Newsgroups react I will receive $117,649.00! With an original investment of only $6.00! And some stamps. AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?

JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the CASH? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try?

Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet.

Remember, play FAIRLY and HONESTLY and this will really work.

EXTREMELY IMPORTANT NOTE: If you try to deceive people by posting the messages with your name in the list and not sending the CASH to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 6 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future CASH. Make sure you print this article out RIGHT NOW! Also, try to keep a list of everyone that sends you CASH and always keep an eye on the newsgroups to make sure everyone is playing fairly. Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the CASH!! GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH.

Please remember to declare your extra income. Thanks once again...

People have asked me if this is really legal. Well, it is! You are using the Internet to advertise your business. What is that business? You are creating a mailing list of people who are interested in home based computer and online business and methods of generating income at home. Remember, people send you a small fee to be added to your mailing list. It is legal. What will you do with your list of thousands of names? That's up to you. So, build your mailing list, keep good accounts, declare the income and pay your taxes. By doing this you prove your business intentions. Keep an eye on the newsgroups and when the cash has stopped coming (that means your name is no longer on the list), you just take the latest posting at the newsgroups, send another $6.00 to the names stated on the list, make your corrections (put your name at #6) and start posting again.

NOTES:
*1. In some countries, the export of the country's exchange is illegal. But you can get the license to do this from the post office, explaining the above statements (that you have an online business, etc. You may have to pay an extra tax, but that's OK, the amount of the incoming CASH is HUGE! And as I said, a few countries have that restriction.
*2. You may want to buy mailing and e-mail lists for future CASH. (Or

Database or Spreadsheet software.)
*3. If you're really not sure or still think this can't be for real, please print a copy of this article and give it to someone who really needs the CASH, and see what happens.
*4. You will start getting responses within 1-2 weeks, it depends.

ALSO REMEMBER
SEND YOUR $1 OUT TO EVERYONE ON THE LIST, EVEN IF THEY ARE NOT FROM THE U.S.

WHAT ARE YOU WAITING FOR???
$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!

THAT'S ALL FOLKS!

Hello...
I just bought a new radio (2950) that has SSB on it and have been
looking around but have not heard anything other than noise and some
very faint sounds that could ahve been talking...
Well I'm just wondering what popular and good frequencies for SSB are
and which onde to use (LSB or USB)..
I have a firestik FS II 4' antenna.. that will work on SSB.. right ???

35 thru 40 on LSB is the most common place where SSBer's hang out
for local yacking. Many more use the upper frequencies during skip
cycles, either on USB or LSB.

The antenna you are using will work fine.

If the antenna is resonant with AM it is also resonant with side band.
It's the frequency that determines resonance or lack of same, not the
mode. Check with channel 40 and work down.

Once again the Professor has done it. I just wanted to let you know the prototype amp that I have been testing out for you is working great. I haven't had this many people yelling at me to tune it down for a long time. Just yesterday, I had half of channel 19 bitching at me. Keep up the good work. I am looking forward to getting the first one off the assembly line. If you hear me out there, which you will, give me a shout...LOL.

The result would be minimalk anyway and the required spacing is not
1/2 wavelength.

Thats what this "1 hot 1 grounded" crap is about? For a reflecter it
wouldn't have to be grounded,just needs to be the proper distance and
the proper length and be metal,thats how you get gain from a vert
side-mounting it on a tower.

Source record: 34391

Isn't a clearfier the same thing that we over on the ham and
shortwave side of the mountain call a BFO? (beat freq.
oscillator). I'm just curious as to why it is called a clearfier
in CB jargan...other than the fact that it "clears up the voice"
on SSB. How did the term BFO go away to be replaced by
clearfier? Not very important question so if you don't feel like
answering....ok. ;-)

655. CB receiving & Shortwave receiving (part one)

Newsgroup: rec.radio.cb
Date: 2000-05-06 00:00:00 UTC
From: Redwire <graydogsNOgrSPAM@yahoo.com.invalid>
Message-ID: <05a451f2.8f9262e1@usw-ex0104-028.remarq.com>
Source record: 34393

Having just recently reentered the CB scene after an absence of about 35 years (thanks for putting up with all my questions) I have made an interesting observation about CBers and their equipment. I have made this observation from the standpoint of a serious shortwave listener (When I say serious....think thousands of dollars in receivers).

I notice if a radio "receives very well" (very sensitive) the average CBer says it is a "noisy" radio and actually counts it as a mark against that radio instead of a plus.

Instead of saying,"boy this readio really pulls the weak ones in under all that static and noise." I find that the average CBer says, "boy listen to all that static and noise...this is a noisy radio." ingnoring the fact that there were weak signals under all that static that the "quite" receiver didn't even know was there!

Just a curious observation. Please see part two of this observation.

656. Shortwave & CB receiving (Part two)

Newsgroup: rec.radio.cb
Date: 2000-05-06 00:00:00 UTC
From: Redwire <graydogsNOgrSPAM@yahoo.com.invalid>
Message-ID: <079f4b4a.399bff55@usw-ex0103-018.remarq.com>
Source record: 34394

See part one:

Why don't CB radios have "notch filters", "Pass band tuning" (or IF Shift or PBS or whatever little trademark name you want to call it), or RIT control, or even a selection of band widths????

Now I know on ch. 19 something like this would be useless. But on the DX freqs. on the sideband I can't tell you how often I have wished for a notch filter during pile ups.

How many of you use external DSP filters of some type? (Timewave, JPS, or even the cheap little DSP-40 that was designed with CB in mind?)

Redwire,
About the 'sensitive' -vs- 'noisy' receivers, I guess it
depends on how you 'understand' propagation, how your radio
works, and if you actually 'know' what it is your hearing.
IF shift, PBS, notch filters, etc, don't really 'do' that
much for 'AM', which is the mode most CB'ers use. I do agree
that all the 'bells-n-whistles' would be nice for SSB. And
as a matter of fact, a DSP filter with an 'auto-notch' does
wonders even for ch-19. (Clarifier = RIT).
Count me in, I use a DSP (JPS NIR-10 for now). Have used
most of the other brands, and liked the Timewave best, of the
'audio' DSP's.
'Doc

Damned Doc I didn't even think about RIT! Thanks. I guess that is
to keep the Xmit freq from changing when you make "adjustments".
I will sleep better tonight now that that is settled.

I was given a Long Ranger BB-125w amp (sn#19303). Has anyone heard of this amp and if so are they any good? I have yet to hook it up and try it. It has a Power switch, a Recv. switch, and a SSB switch. It has 2 mrf453 and below that has the numbers 652(on the pills). Any idea what this would put out for power with a 4 watt drive and would a 20 watt drive be way to mutch? I think it would be but just want to ask.

Thanks in advance

Has anyone tried the Ranger 6900F Turbo which is suppose to have
an output of 225 watts? Is that its peak output or is that its
sustained output? (is the term RMS used with CBs?)

What about the RCI General Grant which is suppose to have an
output of 200 watts? Same question as above.

What are some of the other Exports that put out more than 175
watts?

If I wanted to go for power in a Big Radio without using an
external amp what should I look at?
<<<<<<<<<<<<<<>>>>>>>>>>>>>>>
They should be almost the same radio's based on the 6900-10z board. The RCI may
have the surface mount board which is harder to modify, though.
Youy are best most of the time to buy a radio and add an amp, rather than buy
a combo unit. Most radio's with amps have much more problems than radio's that
don't

ENJOY THIS ONE LADIES AND GENTS.....

A gay guy falls in love with his proctologist. He goes to the proctologist's office and says he has an obstruction. So the proctologist sticks his hand up the guy's ass but can't find anything. However, he notices that the man has an erection, so the proctologist cuts short the examination and orders the gay guy out of his office.
The next day the gay guy calls the proctologist and claims he has another obstruction.
The proctologist doesn't believe him but the guy claims he is in great pain, so the doctor relents.
When the guy arrives, the doctor sticks his hand up the guy's ass again but this time he finds something. "Good God!!!", the doctor exclaims, "No wonder you're in pain-there are two dozen roses shoved up your ass!". The gay guy turns around excitedly and says,
"Oh! Read the card! Read the Card!!"

I had so many so I hope you guys enjoy. I had to post several jokes tonight!!!
So here goes the "JEWISH GIRL JOKE"

A Jewish girl came home one day and said, "Ma, I got married."

Her mother said, "Oy, that's great."

The girl said, "But Ma, he's an Arab."

Her mother said, "Oy, that's not so great."

The girl said, "But Ma, he's an Arab sheik. He's wealthy beyond your
wildest dreams. You and Daddy are going to live in the lap of luxury
for the rest of your lives."

Six months later, the Jewish girl walked into the house and
said, "Ma, I love my Arab sheik, but my God, all he wants to do is
screw me in my ass. Day and night, all he'll do is bang me in the
ass. When I got married, my asshole was like a dime. Now it's like a
silver dollar."

Her mother said, "So for ninety cents you're going to make trouble!?

Little old Lady to Judge:

Your honor, I am 86 years old. So here I am,
sitting there on my front
porch on a warm spring evening, when a young man
comes creeping up on the
porch and sits beside me. He starts to rub my thigh,
and it feels good,Your Honor.
So I don't stop him, and he begins to rub
my old breasts.
Why, Your Honor, I haven't felt that good in years!
So I just spread my
old legs and say to him, "Take me, young man, Take
me!"
He yelled, "April Fool"
and that's when I shot the Son of a Bitch.

You might be from Chicago if...

You don't pronounce the "s" at the end of Illinois

You become irate at people who do

You measure distance in minutes

You have no problem spelling or pronouncing "Des Plaines"

Your school classes were canceled because of the cold

Your school classes were canceled because of the heat

You've ever had to switch from "heat" to "A/C" in the same day

You drink "pop."

You know what the numbers I-80, 55, and 90 mean

You realize that I-90, I-94, I-290, and I-294 are all different
Roads

You refer to any interstate highway as "the tollway"

You know the names of the interstates i.e.: Stevenson, Kennedy,
Eisenhower

You refer to anything South of I-80 as "Southern Illinois"

You refer to Lake Michigan as "The Lake"

You refer to Chicago as "The City"

No matter where you are, when you hear the term "Downtown" you
immediately assume they are talking about Downtown Chicago

You have two favorite football teams: The Bears, and anyone who beats
the Packers

A brawl over which Chicago baseball team is better breaks out
every year at your neighborhood block party (the Sox, of course)

You don't know why people from WI refer to you as a "Flatlander"

You know what goes on a Chicago Style Hot Dog

You know what Chicago Style Pizza is

You know why they call Chicago "the Windy City"

You understand what "lake-effect" means

You know the difference between Amtrak and Metra, and know which
station they end up at

You have ever ridden an "L" (elevator train)

You can distinguish between the following area codes: 847, 630,
773,
708, 312 & 815

You realize what a life you don't have because this is an
accurate description of your life...

Tommy

Little Tommy was doing very badly in math. His parents had tried everything; tutors, flash cards, special learning centers, in short, everything they could think of.

Finally, in a last ditch effort, they took Tommy down and enrolled him in the local Catholic School. After the first day, little Tommy came home with a very serious look on his face. He didn't kiss his mother hello. Instead, he went straight to his room and started studying.

Books & papers were spread out all over the room and little Tommy was hard at work. His mother was amazed. She called him down to dinner and to her shock, the minute he was done he marched back to his room without a word, and in no time he was back hitting the books as hard as before.

This went on for sometime, day after day while the others tried to understand what made the difference.

Finally, little Tommy brought home his report card. He quietly laid it on the table and went up to his room and hit the books. With great trepidation, his mom looked at it and to her surprise, little Tommy had gotten an A in math.

She could no longer hold her curiosity. She went to his room and said, "Son, what was it? Was it the nuns?" Little Tommy looked at her and shook his head. "Well, then," she replied, "was it the books, the discipline, the structure, the uniforms, WHAT was it?"

Little Tommy looked at her and said, "Well, on the first day of school, when I saw that guy nailed to the plus sign. I knew they weren't fooling around."

You just might be a Redneck Crossdresser if...

1. You go to family reunions to meet guys.
2. You chew tobacco. (Chewing is OK, but don't spit, nice girls swallow)
3. You wear a dress that's strapless and a bra that ain't.
4. You wear combat boots with a minidress.
5. You wear jeans with a belt buckle that's bigger than your fist.
6. You have a Ford F150 pick-up truck, with a gun rack, a Dale Earnhardt license plate frame, and a Confederate flag on the tailgate, next to the bumper sticker that says "I sell Avon Skin-So-Soft"
7. You try to wax your legs with Turtle Wax.
8. You braid the hair that sticks through your fishnet stockings.
9. Wear a black John Deere baseball cap with pearls.
10. You use glitter to highlight your moustache.
11. You wear tube tops with your mini, because it shows off your Harley-Davidson tattoo.
12. Your favorite band ring came off a cigar.
13. You keep spare ammo in your bra.
14. You get a run in your stockings while changing a tire on your motorhome.
15. Your purse is a toolbox.
16. You pluck your eyebrows with a pair of needle nosed pliers.
17. You store your lipsticks in a socket-wrench box.
18. You use duct tape to keep your "tuck" in place.
19. You call your vanity "your work bench."
20. You use a pocketknife to sharpen your lip and eye liners.
21. "Doing your nails" means sorting the ten-pennies from the sixteen-pennies.
22. Your favorite leather skirt was made from the moose you shot last Fall.
23. Your new sandals are made from truck tire re-treads your found on the road.

24. You keep a spare lipstick in your toolbox.
25. You wear a pair of C-clamps as screw-on earrings.
26. Your best silver necklace is made from beer can pull-tabs.
27. Your nail enamel is made by Rustoleum.
28. You use paint thinner to remove your makeup.
29. Your moisturizer says "non-detergent SAE 10W30" on the container.
30. If you remove your leg hair with duct tape.

Actually, less. If I remember correctly, when the FCC moved to 40 channels, the tightened the spec for type acceptance. 23 channel radios could be continued to be used by their current owner but no-longer could be sold, new OR used. This was force method to phase the older radios out of existence. But we know how enforcement goes.

While I still will maintain that you are running a bastard Class B, I will also give you the award if it proves out for paying some attention to other parts of amp design. That's a nice way of saying that a lot of what passes for amps is mostly crap.

If you paid some attention to tank design and impedance matching in the output, good job! This alone will cut your heat a lot. Of some interest to me is the input system. A lot of amps cause the protection circuits in the drivers to do the half-fast waltz (not too slow, not too fast, just half-fast) because they are often looking into a major capacitive load. How did you get around it? If you want to heat up a transistor, develop a parasitic. You have obviously spent some time on that issue; how? You chose a simple route, single-ended design and all and let the chips fall over some issues. OK, but what was the logic behind the route you took?

Taking you at your word, did you design it by some masterful plan, do a good job of copy and adaptation (and there is nothing inherently wrong with that), or blunder into it by blind luck?

Dick

693. R&TTE Directive, 1999/5/EC

Date: 2000-05-06 00:00:00 UTC
From: Matt <doormatt@NOSPAMbigpond.com>
Message-ID: <_vPQ4.5210$X4.10932@newsfeeds.bigpond.com>
Source record: 34472

worldwide there are effectively 3 bands, the VHF band - in the vicinity of 156 megs, the HF band - which has a huge number of HF freqs, and of course the 27 MHz marine band which has about 10 or 12 channels from about 27.660 MHz to 27.960 MHz, and 27.880 (channel 88) is the emergency and calling channel.

Mav',
I can go along with your description until you get to
the '10Kw' part, just can't beleive that. With the mag-
mount, your going to be doing good to get 100w out.
The usable 2:1 SWR bandwidth is a bit 'broad' to be
true too. '40 up and 40 down' is probably around a 2 Mhz
spread. That would require a very low 'Q' coil. So low,
infact, that efficiency would be almost nonexistant. the
higher the 'Q', the more efficient it is. Also the higher
the 'Q', the narrower the usable 2:1 SWR bandwidth. It
sounds like more ficticious manufacturer's claims to me.
'Doc
PS - When it sounds like it's too good to be true, it usually is!

The 2980 is based on the 3900 board (Saturn), the 2517 has the newer
6900 board. The 2517 is a better radio.

Steve,
Try out the unofficial RCI web site @ www.rciweb.com. They have a bunch of
fixs for heat related ptoblemd common in the RCI rigs. Of course they all
involve a bunch of parts swaping but what can ya do.
Good luck

I have designed this amp to solve the major problem with most (if not all) transistor amps out there right now. The problems stem from poor matching.

This problem is far reaching in its effects and causes the following:

Transistor(s) run very hot in normal operation causing reliability problems.
Efficiency (output RF power/input DC power) very low. Typically between 40-55%...
Drive power lost to amp and possible instability of driver. (as you describe due to reactive - j component...)
Instability problems with amp leading to tremendous dissipation in device(s) and failure.

My amp adresses this problem by providing an excellent conjugate match (50+j0) to the device from both ends. This is of utmost importantance in order to solve all the problems sited above. This is why my amp puts out the same power as a 2pill with half the current draw... because you can get all the drive in... and all the output to the antenna!

TRC449 Realistic SSB mobile 40 ch, unmodified, never screwdrivered, stock mike/bracket, 858 chassis same as 138 Cobra, but nicer looking, VERY easily modified for lots of channels, this rig is in great condition with only minor marks from mobile use. $100

Royce 641 SSB 40 ch base unit, big and impressive, cosmetics decent, no mods, lights up, keys up to about 5W AM, no mike to test SSB output but rig has never been messed with and can do a lot better than most. $75

HyGain IV 40 ch base, AM only, PLL02a easily modified and peaked, condition is scruffy but works great! Sorry, no mike with it (Selling Turner seperately), but will include hand mike out of the goodie box that you can wire up yourself, for $40 an 02a base isn't too bad of a deal.

All plus shipping, sold as is, prepaid MO only. Email replies please

Greetings!

The regulator you mention, are you sure it's the 7805? It's a 5 volt type. You need the 8 volt one, or the 7808 if you're running the main board PCB power. [The RCI I have has the HA17808 original and does get warm. It's in a TO-220 style package.]

Both regulators, actually all the 78XX series, are designed to give out 1 Amp continuous - and they have thermal limiting and shutdown, or are designed to reduce/limit current when they get hot.

All the 78xx series regulators are linear types, they operate, or regulate, in a linear fashion, and they will always get warm.

The last I knew, the RCI has this regulator on the side panel, if you've got one that doesn't "bolt-on" to the side panel, thats your thermal problem. It needs to have itself, using a Mica insulator, bolted to the side panel so it can have some heat sink area to drain off the heat this regulator creates.

Source record: 34491

Greetings!

It's a simple ratio, the decimal denotes the fractional result.

The Colon separates the two values.

One side is always referenced as 1 - for the purpose of clarity.

The representation of the two numbers are often swapped around.

Like the common denominator - many people just drop the "1" in the equation and just say, "SWR is a 1.5 on 1 but it's 2.5 on 40"

What they are saying is...

SWR for channel 1 is 1:1.5 - or reversed, 1.5:1 - or "one point five to one"
SWR for channel 40 is 1:2.5 - or reversed, 2.5:1 or "two point five to one"

[Like is horse races and other betting pools, it's like seeing the odds placed on the individuals involved in the race.]

The colon separates the two factors, and denotes that it's the ratio.

The "1" in an equation like "1.7:1" always stands for the transmitters own ability to produce power, whether it's in watts, voltage, or current - the means to measure it doesn't matter, because this measurement is the same for both the Forward power and Reflected power. The one denotes the actual Forward [or referenced standard] power, the power is calibrated to obtain a value [reference], then is compared to the Reflected power and it gives a resulting value. These two "values" give you a ratio.

It doesn't really matter how you show it, but the shorthand version like "The SWR is 1.5 on all 40" is really saying that the antennas' own SWR is 1:1.5 or 1.5:1 on all the 40 channels.

In certain mathematic circles, the 1 is shown first, colon, then the resulting value, while others use the value result followed by the colon, then 1.

Just as long as you use the colon, the ratio is understood, if you don't - at least use the SWR contraction of "SWR is 1.5" - a person knowing what SWR means, already puts the one in the right place.

>1. A ratio is always expressed as one number TO another and SWR
is always >expressed as some number TO(:) 1
>
Wow, why did I say three numbers??? I meant two. (Just had knee
surgery and that must have been those pain pills talking.)

So let me re-ask the question. What is the second number? Where
does it come from? I know SWR is a ratio. Does the second number
vary? What am I missing here.?

Example: Someone ask me, "What is the SWR on your rig?" I look at
my SWR meter and it reads 2.1. Do I answer "it is 2.1."? or do I
answer, "It is 2.1:?."

Can there be a 2.1:1 and a 2.1:2 or a 2.1:3. Where does the
second number come from? The first number is a ratio of what?
And can this "what" vary?

Am I overlooking something very simple? (I think I must be.)
Thanks for the answers.

If in fact you have accomplished this, then by all means you deserve the Edwin Armstrong design award, Junior Grade, 12th class. Not much, but we have already awarded the DFC to the designers of most of the CB amps that have passed my door. DFC is Dumkopf, First Class.

As you have noted, a lot of the DFCs customers deserve the DSC so before you do a lot with it, see what happens when you run it on 18 volts into an antenna that waves in the wind and hits the quarter-panel periodically while sitting next to a Suburban with 14 alternators, 3 gun racks, and a rear door held together with Jesus Saves stickers. That, grasshopper, will be the ultimate test of your design.

A conjugate match is not always possible with funny loads and tends to heat a bit itself when called upon to do its thing. One of the oddities of any amp is that the input capacitance varies with drive: this bit of wonderment often causes the inexperienced to align a receiver with too strong an input and wonder why he doesn't hear a thing below S9. So you might want to see what happens when Joe Yoknock drives the socks off of it.

Hey, seriously, design for 27 Megs is not easy simply because it is the area where most HF designs poop out and you can't get into strip lines, etc. that are common on higher freqs (ever seen the strip tuning that 5-10 kw FM transmitters use?). To top it all off, your users tend to do funny things. If you have done this or even come close, my hat is off to you.

Dick

Can't remember the model but it was a Radio Shack model. I had a homebrewed TX and RX at the time that used one crystal per channel and I had about 5 channels. I taaped into the oscilator on the RS radio and fed it into my TX/RX combo and this gave me all 23 channels. Whoopee, I was in high cotton.

Check between 35-40 on LSB. Especially ch. 38 on LSB. Be aware
that the last couple of days hasn't seen much activity lately due
to conditions. when things open up again I think you will
pleased with how many states and even countries you will be able
to work with the 2950. I use one to DX with on CH 38 when the
band is open. Just check every day on LSB and when you hear the
rest of us just jump in!

>Well I'm just wondering what popular and good frequencies for
SSB are
>and which onde to use (LSB or USB)..
>I have a firestik FS II 4' antenna.. that will work on SSB..
right ???

I use a Firestik II with my 2950 and have no problems getting out
when conditions are right.

From: Maveric <maveric169@hotmail.com>
Message-ID: <8f33be$93$1@slb7.atl.mindspring.net>
Source record: 34504

What I am looking for this antenna to do is to transmit and receive better, as well as having a broader bandwidth than my Wilson 5000. I posted this thread to help me gain insight as far as the company claims on the antenna's performance. I don't have allot of experience with antenna's, so I am looking for the false statements or exaggerated statements that many companies make.
Like what Hamm4fun stated ...."the '10Kw' part, just can't believe that...."
That tells me that the antenna probably won't do that (Not that I need it). I don't want to spend $170.00 on an antenna that is no better or worse than my current Wilson 5000.

BFO is a term from CW. Clarifier while the same as a BFO is more for SSB. There is some ham gear and military gear that refers it a clarifier. Technically any osc that feeds a mixer is a BFO. I guess they wanted somthing more discriptive of what the control does for those who do not understand the inner workings of their radio.

Hello...
I just got a 2950, and it works good. i ahve a Firestik for my main antenna, since I mainly chat on the CB bands, but have a mag mount that i tuned to the 10 Meter band. It's rally annoying to have to unscrew and change the antennas each time I want to try a different frequencey.. is there a splitter where it has 2 antenna plugs into one radio where you could select which antenna you want to be active. I know that the other antenna could cover the 11 meter band, but I want to have somethiung that is tight on the 11 meter band with really low SWR.. and the firestk is that..
So is there a way I can have a switch that I plug into the radio and acepts two or more antennas ???

The way to look at the SWR reading is the 1st. set of numbers ie 2.1 is the
relative feedback of signal from the antennae, as in signal to noise ratio,
the final number is the initial value of the antennae (always 1) an optimum
SWR is a value between 1.2:1 and 1.7:1 values outside these ranges are not
producing an effective signal radiating from the antennae, it is fallacy to
think that a dead needle SWR is good the signal ratio is too small and it
would not be effective.

Hamm4fun,
For $170.00, I would expect the 'un-varnished' truth!
The claimes made for this thing are so exagerated, I really
wouldn't expect any more from it than I would any other
base or center loaded antenna on a mag-mount.
There are two claims, that it will 'handle' 10kw output,
and that it has a 2:1 SWR signal bandwidth of about 2 Mhz.
The mag-mount rules out the power handling capability of
10kw, even if the rest of the antenna was made of 2" steel
elements! A mag-mount antenna limits power handling to
something in the neighborhood of 100-150 watts. Don't take
my word for it, try it and see for your self.
A 'usable' bandwidth of 40 up and 40 down? Well, that
depends on what your calling 'usable'. If you mean with
an SWR of less than 2:1, your going to have to prove it to
me. It's just not physically possible. I'm not going to
waste my time trying to explain it, but if you really want
to know why, I can tell you where to read about it.
The antenna in the picture I saw looks as if it is sitting
on the cab of a pickup. If thats true, and if the rest of
the picture is in scale, then the coils are about two inches
in diameter. Figure the inductance of the coils (approximate),
multiply by two since there are two of them, then tell me if
the combined inductive load is enough to 'load' a seven foot
antenna on 27 Mhz. You may be suprized......

Solar activity functions in an eleven year cycle. It is difficult to determine when you have reached the solar maximum until several months after the fact, but we are likely close to the maximum and it should last for perhaps another year or so before it begins to decline. The current cycle is very disappointing compared to the past few.

How in the hell did YOU ever get on that side of the mountain,or are you? A "beat frequency oscillator" is used to set up a beat tone with the signal generated by another oscillator,thats not close to what a clarifier (not clearifier) does.

Its called a coax switch and works well,or better yet find the mid freq between these bands and cut a full-size 1/4 wave whip for that freq,I use this method to work 10,11,12 with one antenna!

Worse radio I ever had was the Cherokee CBS 1000. Ordered when it was still a prototype. Received in factory sealed plastic and carton. Plugged in and I noticed lots of conversations, but no accurate signals, the meter was off, or so I thought. Returned it and received a new one. Same stingy meter. Did conversion(channel mods) and peaked the mod(something it clearly says not to do, but this radio had NO modulation no matter what mic I used, no matter what I did, it just did not sound the way I expected.) One of the memory buttons pushed through it's place and fell into the radio. Fixed that. Both needles began to stick on sideband. RF gain does not work properly and never really did. Lights burnt out in both meters and the radio fried after a few weeks of use after the mod was turned up. Turned it down a bit and it STILL burnt up a second time. Removed the heatsink and installed a larger one. Jacked the mod back up and have it dead keying 3 and swinging 12. Removed the speaker and in it's place went a hobby fan. The radio absolutely screams now on AM and locally it is louder than any other radio I have(galaxy, cobra, royce, pearce-simpson, northstar, and a small collection of 70's rat shacks). Sounds best with an echomax 2000. Frequency drifts on ssb occasionally. After repairs and parts, I have way more into this radio than I should. Note: This radio gets HOT with the mod jacked way up. All in all, this was designed cheaply and poorly.

professor, why don't you turn over one of your prototypes to one of
your homies, take for example dennis #12 or sean and let them test it.
then there will be no questioning the validity of your claims. they
will be independent sources who will either prove or disprove your
claims. until your prototype is tested by someone outside your circle
of influence , then no one will believe that you are on the level about
all this, just a thought,.....cd is out.....

Come over here and I'll slap ya' just like you' mammy done. :)

There was a local guy that bought a bunch of military surplus gear at the Dayton Hamvention a couple of years ago. After asking some questions to find out more about this gear, it turned out that it had gone AWOL from the US military and was for some super secret spy project. Not too surprisingly, the guy here lost all his gear (sorry, no refunds) and ended up coming this close to spending the next few year's accommodations courtesy of the US Gov't.

It seems to reason that with the 10 kc channel spacing, there is no need for external notch filters or pass band tuning because it is supposed to be built in. If someone is operating between the channnels, they are not using a type excepted radio. Also, if you are getting bleed over from another channel, the other station has too much power or modulation causing it to bleed over.

The radio's do have a rit control, called a clarifier.

DSP would a nice feature.

Redwire wrote in message <079f4b4a.399bff55@usw-ex0103-018.remarq.com>...
See part one:

Why don't CB radios have "notch filters", "Pass band tuning" (or IF Shift or PBS or whatever little trademark name you want to call it), or RIT control, or even a selection of band widths????

Now I know on ch. 19 something like this would be useless. But on the DX freqs. on the sideband I can't tell you how often I have wished for a notch filter during pile ups.

How many of you use external DSP filters of some type? (Timewave, JPS, or even the cheap little DSP-40 that was designed with CB in mind?)

I HEARD THAT! WELL NONAME NEVER EVER HAS REALLY WON ANYTHING EXCEPT FOR THERE LOCAL DOWN AT THE MALL SHOOTOUTS! DONT GET ME WRONG THEY MAY MAKE A DECENT AMP BUT THEY ARE NOT IN THE DAVEMADE CATEGORY AS OF YET! THEY WOULD DO BEST BY TAKING A PAGE OUT OF XFORCE AND MOWATTS BOOK. JUST COPY DAVE'S DESIGN AND USE ALL HIS PARTS BUT, CHANGE THE COLOR OF THE BOX AND PUT YOUR LOGO ON IT. MAYBE CHANGE A COUPLE OF PARTS ON THE INSIDE BUT KEEP IT BASICALLY THE SAME AS A DAVEMADE AMP.

As soon as I bought a new radio, the skip has crapped out during the day...

Not as good as the last cycle that I remember...

Source record: 34580

Super Dave,
There are two steps in tuning an antenna. First is
to resonate the antenna, make it the correct length. This
is done by adjusting the antenna's length for maximum
signal radiation, or lowest SWR. The SWR may not be very
'low', which really doesn't matter. Just get hte lowest
reading you can get.
The second step is to match impedances, input impedance
of the antenna and feed line impedance. How you do this
depends on the kind of antenna you have. If we can assume
that you have a commercially made CB antenna, it may or may
not have some means of adjusting the 'match'. It could be
a set of 'adjusting-rings', a gamma-match, or no adjustment
device at all. Which ever the method, follow instructions
to adjust for best SWR. Some antennas have no means of
adjusting either the length or the impedance, and example
being the 'old' 'Big Stick' vertical. The instructions for
the 'Big Stick' said to adjust the length of the coax feed
line to get the 'best' SWR reading. This didn't actually
'tune' the antenna, it mearly 'fooled' the radio into thinking
it had a good SWR. The mis-match was still there at the
antenna. It made the 'meter' read nice, so people thought
worked and were satisfied.
So, to condense all of this, just follow the directions
that come with the antenna. If you really want to understand
about SWR, antenna matching, etc, William Orr's 'handbook'
has a very easy to understand way of explaining it.
'Doc

Comes with manual, svc manual, external vfo, freq display, several sets of extra tubes, including new japanese NEC's. Has new tubes in it, needs neutralization. Has optional am filter and cap for American tubes, both factory installed. Also has crystals for extra 11 meters installed by factory tech. Several sets of extra tubes, including brand new ones. All is perfect except freq display is inoperative- needs repair. See photos at www.hightechspecialties.com Respond email: toomuchstuff@pobox.com . $350 firm + shipping. Also have matching FL2100B amplifier for sale $350 obo. $600 takes the pair. Other goodies FS at the web site also.

Thank you,
Jon

One heavy-duty imitation Sigma IV, with extended overlaps in mast and custom cap feed. Much heavier duty than the original- good in high winds. Used but excellent cond. $100.00

One real, original AS Sigma IV, brand new! $150.00

One original AS J-Pole 10 meter antenna lengthened to 11 meter. The J-Pole is a very trim, very good antenna. Slightly narrow-banded, has 3 db more effective signal at same range than even a Sigma IV. New cond. $100.00

The Sigma IV was a better antenna than the Penetrator or the Sigma 5/8 ground plane. It uses a a 3/4 wave radiator. The J-Pole is also 3/4 wave but is very trim because it has no ground plane radials or shaping ring.

(1) trim, light-duty 20' 2-piece fixed tower, perfect for CB antennas. 6"/side triangular construction. $50.00

Several heavy-duty push-up masts and hdwe. $50.00 takes it all.

Lots of heavy aircraft-cable guy wire, insulators, hdwe from a double-guyed 45' antenna. $40.00

gfd,
Did the noise exist 'before' you put the CB radio in?
If not, then I would suspect that you may have inadvertently
changed some of the AM radio's wireing when you installed
the CB radio. Noise doesn't usually 'follow' another
signal such as you sugest. Rather, I'd think that there
may be a problem with the AM radio's antenna connection.
If the noise existed before you put in the CB radio, then
the CB radio didn't have anything to do with it.
Check to see if the AM radio's antenna lead is partially
pulled out, or if it is broken/kinked somewhere.
'Doc

Hello all.

I have a Cobra 146GTL with a problem. It receives fine on AM/SSB and transmits fine on SSB (has clean modulation). When you key up on AM, it dead keys, but no modulation. The AMC circuit is intact and the AMC pot checks out.

Anyone have any insight on what the problem could be?

I thank you in advance for any help you can offer.

John

Beware of Brian Griffey (aka Professor).

He sells kit amps and calls them his own.

The amps he sells are not competition
quality.

Somehow he's formed a network of stooges
to back him up.

He won't sell to anyone who might bad mouth
him or actually test his claims.

BEWARE BEWARE BEWARE

My recommendation is that you stick with the
old stuff that you're familiar with.

A fully modified Uniden (was President) Grant
and an Outcomm (now Texas Star) amp won't let
you down.

Get a radio that has a great receive and nice rf out, and then get a beam! On 20-40w and a beam, you can get anyone, anywhere.
Good luck
Steve

Greetings!

Beat Frequency Oscillator was too long of a word for people [commoners] to easily understand. And the Manufacturers were too cheap to afford the extra real-estate of the front panel to spell it out for them. The Word "Hetrodyne" can be found on some older radios regarding the use of the control to "hetrodyne" with the incoming signal - leaving the voice as the derived component product of the two signals combined.

Sound confusing? It should be, not too many people that are new to radio, never heard of the Hetrodyne principle used that makes the BFO the way it is.

Actually the circuit can also be called the VFO for Variable Frequency Oscillator, for that is its' function.

Not to be confused with VCO or Voltage Controlled Oscillator, which usually is considered a part of the Phase Lock Loop or PLL, circuit.

The word Clarifier came up as a means to turn, or tune in someone to hear them better, or to clarify their voice during a trashmission, er transmission.

The work Voice lock, became popular because people understood the control mean to lock into somones voice.

RIT, or Receive Incremental Tuning, sounds like a Politically Correct term used more for RF gain purposes, than those for SSB and increasing the clarity of the voice.

So with the above in mind, welcome to Rec.radio.cb...

If you are using a Uniden or Midland, the Clarifier or RIT control in the new words for BFO.

If you are using a Cobra, the Voice Lock is their Politically correct term for the acronym BFO.

Just remember the BFO, can also be called VFO, but not the VCO, or PPO, or CEO - because someone can get real P.O.'d when the can use the RIT, which helps control the VFO which really means BFO, because the VCO is not working well due the PLL not locking in the VCO helping the BFO.

Did that help?

Greetings!

Well, there is a fine line between a "Sensitive radio" and a "Noisy Radio". A lot of it has to do with the components used.

We won't go there...but...

Functions? Simplicity is the key.

Many atypical CB'ers - and the wide variety of different radios out there, many people want to hear the "others talking" without having to turn their eyes towards the radio and concentrate on tuning in the other person.

Having what you're asking in a radio is a serious issue with mobiles. This leads to a lot of problems when you have to explain to the insurance company that tuning a radio was more important than paying attention to the road.

Quite frankly, I wish there was a "PMS" button and a "Viagra" button just so you can go thru the noisy sections using the "PMS" filter, and when on the wide open road, you can use the "Viagra" function to bring in those distant stations.

And when things are really bad, the PMS and Viagra can be used together to help sort things out...

Oh well...

;-)

There may or may not be any difference between a BFO and a clarifier depends on what radio you are talking about. In the case where they are different the BFO that injects to the product detector is a fixed oscillator or at least you can say it is not continuously variable. The clarifier also known as a RIT when operated in this manner adjust the freq being sent to the first mixer(in the case of a single conversion receiver) rather than the product detector.

Greetings!

Why yes, it's been really interesting lately.

Some days, skip just doesn't stop, but just this past weekend the days
are quieter than the nights...

When you get on the net again, check out http://www.spaceweather.com
for some better details on why this is happening.

Click on the links in the page to see some of the different
sites that supply this information - especially the SOHO one.

Lately there has been a lot of CME's going on, with 3 occuring
within a 24-hour period - which does affect reception and skip
propagation.

Need to know what a CME is? Check out the link!

I would agree that a full length 1/4 wave whip has the least attenuation of all mobile CB antennas. At the cost of a very modest amount of attenuation you can get an antenna that is a lot more overpass, garage and drive thru friendly. According to ones needs the shorter antennas are usually "better". I did some testng a while back and found that a four ft top loaded antenna had only about a 1 db loss when compared to a full length whip. It was arguable as to whether it was even as much as 1db.

ohiogs,
Sounds like the vertical element is a bit too long. Try
shortening the vertical element a couple of inches at a time,
till the SWR gets down to a reasonable level, some where
around 1.5:1 give or take a little. The larger the diameter
of the conductor used for the antenna, the shorter that element
can be. At a very rough guess, you could probably shorten the
antenna by almost a foot to get it in the 'ball-park'.
One thing you can 'take to the bank', discount any antenna
manufacturer's claims by at least 50%, then, only believe half
of that! Most claims about an antenna are made by the
advertising department, not the engineers.

Louis,
What your asking is like asking which is the best
automobile to get for a new driver. There are as
many 'answers' as there are people to ask! There is
very little difference between most CB radios. I'd
find the one I 'liked' the best, and go with that one.
Just like a car, to buy a radio you should know at
least a little about them, so you can make an intelligent
choice. Read everything you can find about them,
remembering to use a lot of 'salt' on the claims made
about performance. Then, it's more a matter of what
your 'bank account' can stand than anything else.
'Doc

Jon,
Did a Yaesu factory technician really install an 11 meter
crystal in the FT-101-e? Really??
'Doc

Didn't those have an 11 meter position on the band switch? Wasn't 11
meters an amateur frequency back when those rigs were made? I don't
know this, just asking!

Yeah Shane, here in London it used to be the most popular
channel for the DJs, because they thought everyone was listening
to them on the nine.

Mind you theres so few people out there now it dont really
matter.

Cheers Mickey

i guess the point is that the poopfessor has talked about his amps before and there never has been any concrete proof that he actually has come up with a decent amp design of his own. the people that say they use his amps are either his friends or his alter egos. about two years ago or so, dennis # 12 offered to meet and discuss the situation with him but bryan never would meet with him about it. therefore what can anyone conclude? there is no proof that the professor has any new design and until some independent source conducts testing on his box, then no one can be sure that professor is doing nothing more than dreaming again,.....cd is out.....

The word Heterodyne came from the use of an oscillator that was fed to
a mixer to change the incoming frequency to say an IF frequency. A VFO
allowed you to change the frequency of the desired incoming signal.

Actually it can't be called a VFO, (other than the fact they are
variable oscillators) the purpose of the two isn't the same. A BFO
was meant to allow the reception of CW signals. Although it could be
used to receive SSB signals also

Nope, with a BFO you were changing the frequency of the BFO, with
Clarifier or RIT you are making small adjustments to the receive
frequency. Otherwise they accomplish the same thing.

Hello Ten ohm smoke:

Are you sure your talking about the old Hy-Gain Penetrator 500, one of the best designed, and bullet proof CB antennas ever built! Its has 4 ground radials, and 4 Top-Hat radials, and is 22.3 feet long, and everybody wants one?

There's a guy here on the ng who is trying to sell a few Avanti Sigma 4's, they would be gone if they were Penetrator 500's

11 mtrs was cb when they were made...however the 101E had 11mtr on the dial..plus 10a 10b 10c 10d...pulled the xtrals from 10 and 10b then reinstalled ones that would go "below" one and above "23"..thats all I did to install them...more likely the salesman plugged them in at the time...hardly what I would call a tech job...but it could happen...who knows maybe he has a buddy that works at yaesu.....I have to say that I LOVED my 101E one talking fighting machine...in fact I am in the process in getting it restored to 100% working order (nothing wrong with it..just tuning and tweaking abit) then it will once again be on the air!!!

>From: "TW" tandb80@home.com

>Hi Folks, is there any web sites that explain how to get in key
>competitions. What kind of equipment needed?

Hey..whats up??.....Basically Keydowns are broken up in to various classes depending how many transistors are in your amp..2,4,6.etc...two competitors sit side by side on the "Line" and at the signal (Usually a car across the fiel turns its lights on).They both key up for 10 seconds saying whatever they choose and the winner is the one who is heard by the recieving station which will be a base some distance away
To have any chance at all you`ll need a van or long truck in order to mount multiple antennas and you`ll need to volt up your amps

I hope I did`nt brain my damage.

in this day and age of copying amps and taking the credit i wouldnt let another tech see or have a box i was designing either. anybody remember what x-force did to dave and what 123 did to xforce? these guys were friends, i couldnt imagine how fast somebody would steal the desing of somebody they werent friends with. if the proffessor has a innovative desing then i cant blame him for not wanting to give the design away and if he really is going to sell them then the copiers should have to buy one in order to copy it. all this being said i dont know if he has his own design thats good or not but i cant blame him for not wanting to share his work.

I have a TS 440A/T for Sale. This is a real talker, does approx. 12o whiskeys and I have worked over 80 countries with this radio. Just replaced it with a new Icom 746, and got my tickets, so I need all the extra bands.

1. Comes with original Box & Stock filters, and an owners manual along with a
stack of Mod's enclosed for your use if, you want to do them.
2. Is in excellent shape. On a scale of of 1-10, this is a 9. It has a few
scratches on the face panel.
3. has the all transmit Mod, and the variable power Mod in SSB
4. I have a MC 80 mic, its a 9+
5. I have an SP 230 speaker with the filters and the original box, its a 8 on
the scale.
6. Have an MFJ 748J DSP with manual

If your interested I will sell the complete package for for $870.00 including Insurance & shipping in the continental USA. I will split the package up it your really interested, AS follows:
440= $625.00
MC 80= $75
DSP= $145.00
SP 230 $70

Hey Redneck Dave,

No harm meant, either. Everybody has different experiences with cars. It's just that I've had better luck with GM. Some people have just the opposite experience. While my experience with ignition noise was worse with FoMoCo, I think it was the treatment I received from the local dealer that drove me away as much as the trouble I had with reliability. I probably got a Monday morning "lemon" with that last Mustang. But I must brag a little on that old Celebrity I still drive every day. Bought new almost 13 years ago, I have put over 190,000 miles on the original engine/trans. I replaced the original starter 2 years ago! Other than brakes, tires, batteries, and a few alternators over the years, the car has never had a wrench on it--the engine/trans have never been opened. I am continuing to drive it just to see how long I can go without a major failure. There are no ticks, clicks, hesitations, nor is there any smoke. And for a "radio" car and all round hauler, the little wagon can't be beat. Hmmm, when it does die, think I should buy another Chevy? LOL!

Best 73

Jerry

Bleed over has nothing to do with the amp. It does have to do with the power output, modulation percentage, and with the proximity of the other stations. And since the major problem is the channels on the CB are so close together... bleeding over when you are running 100W is unavoidable!

From: rev_lee@my-deja.com
Message-ID: <8f5m01$7rq$1@nnrp1.deja.com>
Source record: 34701

www.rfllabsinc.com
RFL Labs will be offering in early June a killer new product! Lets face it. We all love to play around with different microphones. RFL LABS Inc. will let you kick that need up a notch with self contained noise canceling microphone modules. Two flavors will be available. A DX module and a ST or Standard module. The DX module will do what it's name implies. The standard module has a wide band response and would be more appropriate for local talk. Here is the really fun part. You can fit these bad boys in the body of an old dynamic microphone. I see a lot of you folks firing up your soldering irons already. Early June is not that far away. For the preliminary specs go to:
rfllabsinc.com

Sent via Deja.com http://www.deja.com/
Before you buy.

Bill Eitner <kd6tas@netzero.net> wrote:
: Beware of Brian Griffey (aka Professor).

: He sells kit amps and calls them his own.

: The amps he sells are not competition
: quality.

I am not sure that "competition quality" is any real recommendation or indication of purity of signal. It often means just the opposite, excessive modulation creating a lot of unnecessary splatter.

: Somehow he's formed a network of stooges
: to back him up.

: He won't sell to anyone who might bad mouth
: him or actually test his claims.

I wish Brian would send one of his amps to a neutral party who has the facilities to do a thorough checkout of the performance of the amp. We would then know if he has designed a unique and quality amp, or not.

To me, endorsements by various individuals or winning "shootouts" are worthless for determining the worth of a unit.

: Talk to me about the antenna.

: If the antenna sucks you have nothing.

But a lousy antenna is unlikely to cause garbling of the signal. That is
most likely to occur if the amp is being overdriven.

I agree. The Telstar engineers (Gunsmoke ect.) may cheat and skew the performance of the representative amp. They might even go to the extreme and make one work.

ok the cm-10 is just a cheap radio as far as i go because I own one , dont expect much from it . On the other hand the magnum 257 is a very rugged radio and I also own one of these beauties . it is varyable power in all modes and is the only radio in its class that will put out a full byrd 30watts on fm with out any conversions and will take that power level all day just loafing . contact rflimited.com for further information. don,t just take my word.

I picked this antenna up at a yard sale new in the box and it says its a halfwave. I tried a test run on it and cannot seem to get a decent swr on it. I have it 20 feet off the ground and 60 feet of 213u coax. I added a ground wire from the mounting bracket to an earth ground.
The antenna is capable of adjustment
from 25mhz to 50mhz.
I was trying it out on 27mhz, at about 18 feet in overall length.
It is showing 3.4 on channel1 and 3.8 on channel 40.
I have tried adjusting up and down and cannot lower the swr.
Has anyone out there ever tried one of these, it has the static rods at top and four ground radials at the bottom.
Thanks in advance.

Whoa amigo. . back the truck up. . . an antenna can be mismatched and cause the coax to be radiating RF. That RF could get into the TX audio and cause garbled audio. An antenna can be too close to the operating position and be working correctly and radiate RF into the operating position. . same kinda situation. . .probably exacerbated by the much higher output power from the amp.
I would put a good (Bird 43) Wattmeter in line and measure forward and reflected power on the antenna. Run the whole assy into a dummy load and listen. Fix the antenna if it needs fixing.
If you find no antenna issue. I might put a voltmeter or scope on the battery to see if it has enough Ampacity for the amp. If Vcc moves around you will have distortion. That distortion will show up even into a dummy load.
The next item I would look at is the linear range of your amplifier. If you are over driving it you will generate all manner of distortion, flattopping, and general feculence.
All the best,
Art

> used or owned?

I've always hated working on the 1970s Royce "wireless" radios with double-sided PC boards. They are a box of bad solder joints, and instead of having hard-wired pass-throughs or plated-through holes, they had brass eyelets crimped into place to make the connections from one side of the board to the other. They're damn-near impossible to get a good solder joint with. You can spend hours working on one of these clunkers and still not get all of the problems fixed.

do you mean competition quality as in will take way too much drive, over voltage, not any good on ssb??? those are things that do not interest me. the majority of normal cb'ers dont need a amp to hold at 20 volts or take half as much drive as the final output. we'll leave those needs to be filled by dave and the x-force guys. us normal talkers will keep with the good clean running boxes while you guys use the competition boxes.

the exportradios.com site is similar to all other amp dealers. they will always steer you toward a peak meter because it shows there amps doing more watts. just remember that these are the right way to measure the signal but a 200 watt peak amplifier will only do a 50 watt or so dead key, and not 200 so the advertises will only tell you the peak wattage of amp,. when you go to buy one always ask what it does rms too and that will tell the real story.

957. ROYCE 642 AM/SSB MANUAL

Newsgroup: rec.radio.cb
Date: 2000-05-08 00:00:00 UTC
From: "D.K.W." <crylo@swbell.net>
Message-ID: <3916EA8E.7D44CCFF@swbell.net>
Source record: 34730

I am need of a manual with schematics for a Royce 642 AM/SSB CB base station. I would even settle for a copy of the manual if you have one. Please email me at either crylo@swbell.net or at crylo@excite.com. My Southwestern Bell email is down sometimes, so if I don't answer your email send it to my excite mail account which I can check while at work. Thanks alot, Kelly

its just changing to summer time dx which is traditonally more north and south.
the dx is good every night to the south pacific and when summer ends it will
start booming in from europe in the mornings again like it did this winter. it
happens every year the same way

Why don't you send one of your amps out to someone who will truly report the quality of the unit? it is very easy to test one of these units, if they are as good as you claim then a good report would increase your sales.

968. Glass Mount Antennas - How good are they ?

Newsgroup: rec.radio.cb
Date: 2000-05-08 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <GJCR4.37558$Xk2.136982@tor-nn1.netcom.ca>
Source record: 34741

Hello there,

Just bought a used CB and am now looking for an antenna. I like the look of the through the glass types as they are not so conspicuous, but I want to know how well they perform compared to something like a small mag-mount (K-30 or similar). Being as they are not a direct connection (rather coupled through the glass) is there any loss or other effects ?

If anybody has any comments, please drop me a line.

Thanks in advance,

Richard.

Mind you they used to do back in 1981/82 post legalisation of the UK
channels.. Died a death so to speak :-(oh and no pun intended... :-)
Mind you, Just take a look at the FCC/CEPT Channels here in Europe and
they bloody ignore it too..
Ahh well

Don't waste your time with a through the glass antenna. You will be dissapointed. Personally, I am also against the mag mount antennas. I bought a new Wilson 1000 mag mount and it didn't even stay on my truck for a month before it was stolen. I now have a Wilson 1000 roof mount and it has been there for about 2 years. There are a lot of good antennas, but I would high recommend that you not go with the through the glass antenna. Your ground and ground plane is a very large part of how well you radio gets out and with the through the glass antenna you have neither. And make sure that whatever antenna you end up going with get the SWR's set on the antenna. Good luck.

Well, the first thing I would ask is what kind of meter are you using to check the SWR's. If it is a cheap truck stop meter then you probably won't get very good readings. Also, check the SWR's on channel 20 also since that should be the lowest SWR and from there going in either direction your SWR's will rise. I don't much about the adjustable antenna, especially going from 25 to 50 MHz. Mine only covers 10 and 11 meters. Maybe someelse will have some ideas on this matter. Good luck.

976. HELP - BLEEDING OVER CHURCH PA SYSTEM

Newsgroup: rec.radio.cb
Date: 2000-05-08 00:00:00 UTC
From: "D.K.W." <crylo@swbell.net>
Message-ID: <39177715.B3EFD91A@swbell.net>
Source record: 34749

I have a little problem. My new Antron 99 is bleeding the PA system of the church down the street. And it did it right in the middle of service on Easter Sunday. The preacher was very happy to say the least. I have installed a low pass filter, but I don't think it is doing the trick, because when I have my box on it is still coming in over my computers speaker. I have my antenna at about 40 ft. Any ideas on on making my neighbors a little happier and keeping the FCC away from my house.
Thanks in advance.

But that certainly isn't the way to figure output wattage... unless you have
a 100% efficient amplifier!

The output power of that amp would be more like (130)(16)(0.5)= 1040W
figuring 50% efficiency.

I have an RCI-2950. It has 10 memory positions. The manual is very easy to understand about how to store frequencies in these 10 positions. But no where does it mention how to go directly to one of those memory positions after you have programed them. It does tell how to scan the 10 memory positions.

Is it possible to "direct entry" to one of the memory positions?

It's no dream. It's a reality. I talk without interference within
10kc's of clean stations that would give me an 60 db signal
if I was on the same frequency as them. I don't even know they
are there. They don't even know I am 10 kc's away.

Does a CB whip mounted on the roof of a car materially increase the chance of that car being struck by lightning? If the whip were struck, would the car occupants still be protected by the body or might the lightning travel down the coax?

"D.K.W.",
Your playing a 'loosers' game to start with. You could correct the problem very simply by taking your 'box' out of line. I seriously doubt if thats what you want to do though. The low-pass filter is a start. In addition to that, 'clean' up your signal by adding band-filters to the amplifier (not a simple job), make sure you have a good RF station ground, add a second low-pass filter between radio and amplifier, and try reducing the driving power to the amplifier. The 'pat' answer is to make sure YOUR station is 'clean', but that won't work for you as long as your running the amplifier. In your case it is YOUR problem, not theirs.

Yes.

> If the whip were
> struck, would the car occupants still be protected by the body or
> might the lightning travel down the coax?

It could but the coax would likely burn in two instantly. Certainly, like
any lightning strike... you could be injured. But remember the odds of being
hit.

988. AM vs. FM ?? beginner question ....

Newsgroup: rec.radio.cb
Date: 2000-05-08 00:00:00 UTC
From: "Steve T." <texsteve@usa.net>
Message-ID: <3917666E.11748A66@usa.net>
Source record: 34761

Hello everyone....
I'm kind of new to the radio hobby, but have been into CBs for a couple of months now. I am interested in getting my HAM license, but just have a few questions..
do HAM operators use FM or AM, like us CBers... what is used when someone say they are using the 10 meter band to make contacts around the world ?? FM or AM; how many watts ??
Can an antenna handle both AM and FM ??? I was thinking of getting a high power CB/HAM antenna from Radio Shack (about $50).. would I be able to use that for talking on ten meters.. and if yes would it handle both AM and FM or just AM ???
Any clarification would be most useful...
Steve

The preacher was very happy? Then you should continue to use your radio so he'll be very happy every Sunday!!

Actually, what you might do (if the preacher lets you), is to install some RF chokes on the lines between the PA and the speakers. This should help a little.

It does, I doubt very seriously that is the amount of drive that is causing
it to sound bad, maybe the quality of the drive, but I don't think 100 watts
of forward drive is fine for that amp.

dbb,
An antenna on your car will make absolutely no practical
difference as far as being struck by lightning is conserned.
If it was struck by lightning, of course there will be some
damage. How much, and to what, is any ones guess. Cars are
struck by lightning, but the cercumstances are always unusual
and very rare.
Contrary to what you may think, the rubber tires are not
very good insulators, under normal conditions. Ask one of
the high voltage crews from your power company.
'Doc

> 'Doc

Yes Doc they sure did !!!.

Yaesu made FT101E's for various markets around the world and the 27 Mhz band was allocated in Australia as an Amateur band up until some time in the 1970's before it was allocated to CB..

I had an FT101E with the 11 Metre band installed at the factory and the Band Switch position appropriately engraved on the front panel. According to the instruction manual supplied the FT101E covered the range of 26.9 to 27.5 Mhz. and the crystal for this range is listed in the parts list as well.

The Australian Amateur 11 Metre band was 26.96 to 27.23 Mhz.

Perhaps the one that you are enquiring about was an FT101E designed for the Australian market or some other area where Amateurs still had the 11 Metre band allocated to them

Generally true but there are still cases where BFO equates to clarifier. Then again the only cases I can think of are on some pretty old radios.

--
Yes. Although with the already minute odds of ever getting struck in
the first place, its safe to say you're not making much of a difference.
If your vehicle is struck, your tires act as an insulator preventing
you from turning into a crispy critter, although your electrical gear
will probably not be as lucky.

Unless you're running tower cable in your car, the coax will fry
"instantly".
If you are running it, I've seen tower coax (~5 in. dia.) go
crispity and still RX/TX. We've had the same tower struck three times in
the past ten or so years with varying results each time.

If you're just absolutely petrified of getting struck, you could
always go buy yourself a lighting arrestor. It'll cost you a pretty
penny for a good one, but they do prevent a whole hell of a lot of
damage.

I used to have a little tunable Fm transmitter that put out about 10 watts. I found that by modulating it with a 10khz tone I could burnout the tweeters in the offending stereo system. This concentrated all the power in the stereo to the tweeters. Unfortunately this only worked if they were listening to FM.

1016. Re: AM vs. FM ?? beginner question ....

Newsgroup: rec.radio.cb
Date: 2000-05-09 00:00:00 UTC
From: W5LZ <w5lz@oio.net>
Message-ID: <39179ED2.54233A9C@oio.net>
Source record: 34789

"Steve T.",
Hams can use AM an/or FM depending on what frequency
they are operating on. FM is only a different way of
placing 'intelegence' in a radio frequency signal, it in
it's self has nothing to do with power. One watt of FM
power is the same as one watt of AM power, or CW, or SSB.
The 10 meter band is only one of 15 bands available for
amateur use. It's propagation characteristics are such that
at times you can 'talk' anywhere in the world. And this can
be done on very low power. Some hams only use low power, in
the miliwatt range, and do very well that way. Of course
using more power does make it easier.
If an antenna can handle 100 watts of power, it doesn't
matter if it is AM, FM, SSB, CW, SSTV, or what ever. A watt
is a watt, is a watt. The only reason some antennas for FM
are different than for any other mode, is polarity. Usually
FM is a 'vertically polarized' mode. Thats because usually
FM is used by mobiles which use vertical antennas.
Antennas for 11 meters are just a bit longer than antennas
for 10 meters. This is because lower frequencies require
longer antennas and higher frequencies require shorter antennas.
The length depends on frequency. You can make an 11 meter
antenna work on 10 meters, but not very well without changing
it's length (this is called tuning an antenna). If you do
that, you have to change it back for 11 meter use. Easier just
to have two antennas.
If an antenna is tuned and has a low SWR at the frequency
of use, it can probably 'handle' any amount of power you will
put into it. There are exceptions to this, usually antennas
that use a 'loading' coil, or an impedance matching coil. In
these cases, the coils have to be large enough to handle the
applied power also.
Hope this might help clear up some of the 'mystery' about
antennas......
'Doc

....Perhaps I missed something here.... but if you're trying to calculate the RF Power output, the above equation is useless. The equation above is for DC Power (not AC, like RF)... it might be fine for figuring the INPUT wattage of an Amp, which typically is almost twice the output wattage.

Reliability in the face of abuse IS a real
recommendation.

Purity of signal is the same as horsepower
with low emissions in that one begets the other.

> It often means just the opposite,
> excessive modulation creating a lot of unnecessary splatter.

You forget that the input signal dictates the
quality of the output signal.

With linear amplifiers, the amplifier cannot
create "excessive modulation."

I'm glad you're clear on what determines the
worth of a unit.

Unfortunately, not everyone agrees with your
determination.

> might the lightning travel down the coax?

Chances of being hit by lightning in a car are slim at best... lots of other higher targets almost anywhere else you look. NOT to say it never happens... in fact I witnessed a car strike once (no antenna on car). The driver was alone and unharmed as the lightning flowed on the sheetmetal and frame of the car to ground (remember... 6 inches of rubber tire are no insulation at all when you consider that the lightning may have traveled through several thousand feet of air (an insulator) to get there!)

'Course.... if you really want to protect the car and occupants, you could ground the car with some #6 wire and clamp it to a nice ground rod.... it'd make trips to the store a lil' harder <grin>.

also another way to make sure is that it has an aluminum wire "gama match" that extends from the bottom curles over the bass of the ground plain up the main a couple of inch's and back to the grond plain . look for that it is not a hygain 500 with out that and it is 21feet 6 inch's.

Is European 250 voltage measured the same way as US ???
I`m talking 2 phase 3 wire.
Phase to phase 250 volt ??
Phase to ground 125 volt ??
Or is it
Phase to ground 250 volt ??

Hope this makes sense.
Thanx for help
Randy

Doc gave you the word. Being illegal, it is indeed your problem.

The one hope you have in all this is that you may not be the only one. Having been the volunteer audio tech in a church that happened to be on a busy street, this problem is familiar and how. If you are a nice guy and the tech plans to bullet-proof his system against any wandering minstrel with a lineear in his trunk not to mention the FM buzz from the gendarmes, you may luck out by being his test dummy.

In most churches, audio has gotten out of hand. The wireless mikes feed a console which feeds three amps for the cry room and the kitchen not to mention the sanctuary which feeds also a tape system to record the preacher's words for posterity and pick up every Bic-flick for 6 blocks (beware old reel-to-reel systems). Between the console and the PA amp is an equalizer that negates the building acoustics so you can hear the female reader as well as the leather-lunged preacher for whom the building was designed. There is enough audio compression to serve as the local studio for WINO so the pastor can wander around the pulpit and the reader can move lips without moving air. There is probably provision for the hearing-impaired somewhere. If this collection of hardware does not leak and pick up signals from Jupiter it would qualify as the Miracle of the Ages all by itself.

It will take all of the tact and diplomacy you have available and a talent for humble that probably exceeds the best the church has to offer but assume that you are not the only one, make it plain that you will stay off the air during services (ask for times) and are quite willing to be a test source for curing the problem once and for all if they are having other problems. Be aware of weddings, funerals, wakes, etc. Do not, under any circumstances, get into their audio gear physically; don't even look at it.

Slim chance but the only one you realistically have. Odds are the tech has done this before so carry the toolbox, do what you are told, and shut up a lot. Get adversarial and you will have your head handed to you with lots of

creamed peas and cocktail onions. RFI is a royal pain in the bazootie to find let alone fix so plan on being limited for a while.

If I had to make some guesses, you will probably find an el-cheapo wireless mike receiver (did anyone say Realistic), a tape machine with the audio input attached for no good reason, or the inevitable busted shield on a lo-impedance line somewhere. Good luck.

Dick McCollum

>I'd like to see the competitions make available a single antenna class.

I`ve always felt if it were truly a "Mobile" competition then you should compete as you would drive on the street....To compete in "Street rod" classes at the race track your car must show that it can perform in normal traffic driving.....I think the same should be true of key downs.You should only be allowed to key with an antenna system you could drive around town with...If I`m not mistaken thats why the "Super Antenna" class was first created for guys who wanted to build these 5 element beams and stuff

I hope I did`nt brain my damage.

>From: lowrider667@aol.com (Lowrider667)

> no name will be the amps to have soon .

Hmmm.Is`nt that what "Gator,Dominator,Heavy Duty,Loud Mouth.Etc,Etc,Etc" all said??.Its one thing to build an amp its another to have the resources for a nationwide mass market network of distibution.Because no matter how good your amp is you ain`t gonna make it just selling them in one small area of the country.What No-Name will have to do is put together a team to compete on the national level and have their name show up in the winners column enough for people to notice

I hope I did`nt brain my damage.

Thanks for all of the replys. Yes, I have already disbanded with the linear.
I don't need the headaches, but I may get another in the future, who knows.
I would rather be able to use my base any time I want that to have to keep
up with the church scedules, especially since it is a Catholic Church with
midnight masses and all that.
Thanks again.
Kelly

buy a cleaner amp, stop overdiriving the one you have now, or turn down your audio but the best answer of all is to stop talking on sunday mornings

1068. Re: Need help with European Electric code !!!!!!

Newsgroup: rec.radio.cb
Date: 2000-05-09 00:00:00 UTC
From: "Charles H. Stoyer" <goofus@interpex.com>
Message-ID: <e3XR4.21123$Lx.3604806@news-west.usenetserver.com>
Source record: 34841

European 250 V is like US 110 except it is (about) double the voltage and 50 instead of 60 Hz. The ground wire is for safety just like ours. Hot to cold=250 V, Hot to ground = 250 V, cold to ground = 0 V.

They don't have 110, that's why you need a transformer to get 110 for running US stuff.

Charles.

I'd like to see competitions using stock voltage. I'm not going to waste
my money keying against someone using more volts. There should be a
stock voltage class and a volted class. How about 12 volts and 1 antenna?

I am a proud owner and user of Dave Made products, BUT, that does not rule out the fact that Stickman builds a very good amp. As a matter of fact my guess is most of you have never really seen or used one of his amps, and are probably repeating what you may have heard from someone else. It is true that Xforce, Mowatts are copies of nothing more than Dave Made using his design and buying components from the same suppliers the same guy that worked for Dave started Xforce and now works for Mowatts. No Name in fact buys cabinets from Dave as well as a few other parts, but his amps are far from a copy of Dave's. I talk to Dave on a regular bases and have a very high respect for "The man", and I am well informed for his reasons for selling parts to Stick, helping him with some design issues as well as understanding his respect for Stickman (if you doubt me call him). No Name has overcome some of his problems such as "army green" and blood drawing cabinets. My guess is, he really needs to have some better guys using his stuff in the competitions to get the respect of "True competitors" I have never seen a Cookie built, Gooserider, or a Skullcracker, hey! but they don't win on the East coast either, that doesn't make them junk or any less of an amp! Foxie wins with BB, but, Dave, No Name, Mowatts, Xforce...would as well, in his truck with the alternator power as well as the superior antenna system that he has perfected. I personally believe that Dave is by far the leader in this industry, But give the Devil his dues, he (Stickman AKA No Name)has a good, strong, and respectable amp!

See, that's the misconception. Tires don't help at all. They get rid of some of the electrical charge. The rest surges through the car's electrical system. You can still be electrocuted if you hit a power pole and the line falls on your car. All you have to do is not touch anything inside or outside the car that is metal or that can conduct electricity.

Congrats on unhooking the linear. Now, if more folks would do the same,
the air would be a LOT clearer. Unfortunately, a lot of guys still
believe that "watts = balls," and until they feel secure enough in their
masculinity to transmit legally, the air will be clogged & cluttered.

"D.K.W." wrote:

The cleaner amp will not help a thing although it is a good idea. If it is the harmonics getting into the equipment all they would hear is unintelligable distortion. If they are hearing you loud and clear on the PA reduce your power, curb your operating times, the churches equipment could use some work to keep you and others out of it. This was a fairly common problem when I lived in Soth Georgia. There were a lot of small churches out in the country and a lot of deer hunters with CBs. The problems I found with them was mostly due to poor grounding and bonding of the PA equipment. When repairs were made not only were the cbers kept out but the system sounded a lot better. The other problem was with rf coming in on the speaker wires, a couple of bypass caps from the speaker terminals to the amps chassis usually fixes this provided the grounding and bonding has been done.

1080. Re: HELP - BLEEDING OVER CHURCH PA SYSTEM

Newsgroup: rec.radio.cb

From: G SEVEN <superiorwavelength@prodigy.net>
Message-ID: <8f9lm9$33to$1@newssvr04-int.news.prodigy.com>
Source record: 34853

Here is a couple of things that may help that I have done to prevent TVI.

First get rid of the A99, its a bleeder. If you can go to a small 3 element beam or longer. While your signal will be stronger out the front it will iliminate alot of un necessary signal out the rear of the antenna. This will reduce the problems of bleeding on neibors behind you. Put the antenna as high as you can in the air. If you can add a vertical element to the rear of the beam and add a back door rejection kit that wood hep too. Just a bunch of bare wire thats added to the rear section of the beam thats all.

Second keep the limiter in the radio and use a stock mic on a radio that has not been tweaked & peaked. Keep your audio level to a minimum while still being ledgible. Use a amp, preferably tube, that is class AB. If it has a tuned PiL network even better. With 200 -500 watts on a beam with the right conditions you can shoot skip anywhere. Use 200 watts for normal skip and pump up IF it gets real ruff.

Now with all that in mind, lets talk about grounding and filtering. Use decent grade coax with plenty of shielding(RG 213 maybe?) and low pass filters. RF Parts sales a decent filter. Not all filters are made the same and the only real way to know if it works is to test it. You can also request charts from the manufacture that will show loss curves and there cut off point. Use a low pass filter from your radio to amp and one low pass filter between amp and your antenna. . Attach 4" long 1/2 to 3/4" wide individual ground straps to each piece of equipment in line at one end, at the other end attach them to a 4'' by 5' or so 1/8th of inch thick flat copper sheet. This sheet can be drilled into the desk in the rear of all equipment inline. Use solder to attach each end of braid to the copper sheet if you can. Then take one long thick braid strap and attach it to the copper sheet on one end, and attach the other end to a copper ground rod in the dirt. If you can use at least 3 rods and attach them together a foot or so a apart. Use the shortest length as possible from the copper sheet to the ground rods, and use the longest ground rod you can find. Minimum 10'. Make sure you have good continuity to ground on all pieces of equipment in line.

Use ferrite split core and rap a couple around each AC cord going to power outlet strip. Then use a long 10' inch long 1/2" diameter or so rod and wrap the terminal strip cord around the rod as many times as you can before plugging it into a receptacle.

Go to the swap meet a buy a cheap 10-20 MHz oscilloscope for $20 or so. You can find then, you just need to look. Take the input probe and wrap it wire several times around the coax going to the antenna. Monitor the scope for over modulation. Should have a perfect envelope, with out flat topping of the wave form.

The following is optional and depends on whether your really want to get rid of the problem. Buy you neibors high pass filters for the there TV sets and buy EMI inline modular filters for the there phone lines, or even go as far as buying them 900 MHz digital phones. The modular filter will need to be attached as close as possible to the effected device. You may also have to put ferrite cores on speaker wires from computers,stereos, and such. Even with all this in mind you still may have problems, but it should cure a good 70% of it. It seems like theres no known method to man to get rid of the 3rd order Harmonics. The problem comes in that allot of electronic equipment is highly susceptible to spurious signals and lack the rejection needed to solve radio interference. As we move closer to the digital age it will cure most of this, but there always Grampa ,by right, who just doesn't want to part with his phonograph. These may take generations to filter out.

This is just a starting point, there is allot of other ways to combat the problem but that usually requires cooperation from your neibors. That is more easily said then done. I also suggest going out and buying a book called "Radio Frequency Interference" Published by the American Radio league". If you love your hobby you will do what is necessary to solve the problem, if not just pull the plug and go mobile.

KRS

1081. Re: what is the best 5/8 wave base antenna?

Newsgroup: rec.radio.cb
Date: 2000-05-09 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <20000509143642.22330.00004310@ng-md1.aol.com>
Source record: 34854

There are basically two types of 5/8ths, those that had wire wound loading coils at the base to match them to the feed line and those that used some other method. The ones that used the coils were garbage. Whatever gain that was to be had from using a 5/8ths the coils took away and they could not handle power. I belive the Penatrator had kind of a looping piece of aluminum tubing in place of the coil and was one of the better antennas.

The point is that a 60db signal whether generated by a clean 4 watt
radio or a clean 1000 watt linear will not cause interference 10kc's
away.

Of coarse if you have a radio with a poor reciever this can create
noise by a faulty design. Many if not all CB radios fall into this
catagory.The noise is not actually there. These recievers are just
incapable of dealing with strong off frequency signals and generate
these "bleedover noises" within themselves.

Most quality "real ham gear" have much better recievers and by
using them in conjunction with "real ham amplifiers" you can talk
10kc's apart without interference.

>HAAAA! Sure ME. Whatever you say. You had better "Dream On", or get a
>better receiver.

The sign of a good reciever is not its sensitivity. Rather it is its
sensitivity working in conjunction with its selectivity. You probably
have never used a radio with decent selectivity.

I talk with 60 70 and 80db signals just 10 kc's away all the time.. If
I didn't scan around I would never even know they were there.

Of coarse this also means that the soarce of these 60+ signals
has to be clean. This is possible even with 1000 watts.

Hello there.

I got used ICOM IC-745 in very good shape. And now I am looking for
FM modul (IC-EX242) to operate on FM. I know this is old tranciever
but it works very well. If you have any informations about that and also
the price I would be very glad to get any information.

Thanks for now and have a nice day !

i had a problem like this before but only once, the radio was fine until the chipswitch was added but then the power would increase or sometimes decrease wildly if you took the top off. also it wouldnt work well below 26 megs with the top on but worked fine with the top off. wierd. i never did know why it did it. i just put electrical tape on the top cabinet to stop it from contacting the chassis and adjusted the power with it like that and never had any further wierd things happen witht he lid on or off because the radio thought it was always off.

Ah yes America, the home of litigation. What a state of affairs,
when you cant even buy a decent antenna because the
manufacturers are afraid you may receive an electric shock from
it and they wind up facing a multi-million dollar lawsuit.

The average lawyer in USA must have at least three houses, a
Rolls Royce, private jet, spend three days a week on the golf
course, indulge in four holidays a year and just for good
measure throw in a couple of mistresses or toy boys.

Just going slightly off topic I raised the question in another
NG as to why it cost me here in the UK $150 for root canal and
crown and why It cost $750 plus, in the USA. The reply I was
given was that the insurance cost the dentist has to pay is
astronomical. One slip with the drill and the dentist is in deep
sh*t.

Now that really does make you wonder

Cheers Mickey

I was in a pawn shop and saw these two huge radios called Siltronix.
The guy had the manual and it said it sends and receives on 10 meter, and
recieves only on 11 meter.
Can these be made to tx and rx on both.
It was called a Siltronix 1011 and its a huge tube job from the "60's".
The guy has 2 of them and wants $ 300 for both.(or $150 ea.)
Said if he didnt sell he was going on e-bay with them.
Anyone familiar with these?
Ken

Have a Commander B4500 in ex.cond. This is a solid state base amp rated for 450 watts PEP output. Uses four (4) MRF-454 finals. Very neat looking amp. All black with white lettering. LEDs for power on,rec.amp,tx,and rec.Built in fan. Also has big output meter. Very well built. Price is $375.00 + shipping from 96003 (no.Calif.). If you need more info you can call me at (530)241-0843.

Take care,
Stan

1098. Re: Need help with European Electric code !!!!!!

Source record: 34871

Here in the UK workers on construction sites by law are only
allowed to use 110 volt power tools. This is due to the high
number of deaths caused by electric shocks using 240 volts. The
power supply is 240 volts, it is then run through a transformer
bringing the voltage down to 110 volts, hence no longer leathal.

Cheers Mickey

They are more trouble than they are worth. However if you are looking
for a radio that would teach you a lot about radio theory then these
are the radios for you. Just by the normal operation of these radios
you are forced to make adjustments just to make them operate
satifactrily

The 8950 transmitting tube is expensive if you can find it.The
Slidtronix will not stay on frequency for long. It will constantly
drift on you. This will quickly become a nuisence on SSB.
The sound is muffled on AM unless you make some modifications
to the radio.

If you can get one for $50 dollars then go for it. The $50
tuition fee is worth it.

Best case: your coax connector gets warm. Worst case (and most likely
scenario): you blow your finals, rendering the radio useless.

Not recommended.

> is no antenna atached? Does anything neccesarily happen? What's the
> best and worst case scenario for this? Thanks...

If the radio is well designed the ALC circuit will cut back the output
to prevent the finals form failing. If it's a poorly designed radio the
usual result is either an open in the in the final or it may short
causing the radio to blow fuses. (provided some one didn't replace it
with a 20 amp fuse)

Laterz.....

Best case: your coax connector gets warm. Worst case (and most likely
scenario): you blow your finals, rendering the radio useless.

Not recommended.

Frivolous litigation (or the constant threat thereof) is responsible for much
of the "hidden cost" in most of the items we purchase. Cars, medical services,
sporting goods, you name it.

How long before people finally wise up and say "enough?!"

Scott,

The worst case is that by transmitting without an antenna, you'd burn out the final transistors. If your radio happens to have a protective circuit to deal with this or a shorted feedline/antenna, it would merely reduce power or shut down the transmitter. For a second or two--maybe longer--it probably wouldn't do anything. Why would anyone want to do that anyway unless, of course, it was accidental, or there was a problem with the antenna?

Jerry

I didn't see it, but did you say you tried another speaker......? and if
that is ok, how about this, is the distortion present on
receive only, or can you hear the distortion when you transmit to the good
unit. (on the good unit)
Try to pin it down to the audio ckt I guess. Oh you didn't mention if you
had a modulation monitor or not.
that give ya a pretty good look at what's going on especially when
transmitting etc.
Outside of that I would suggest a possible leaky cap.......poor solder
connections, and also clean up the PTT switch .

Source record: 34895

Hello Mickey: The Penetrator 500 faded out of the picture as did the CB craze in the late 1970's. The skip cycle started to fad in the late 1970's which slowed down a lot of CB sales. Hy-Gain was bought out by Telex in the very late to early 1980's. Telex cheapened the Penetrator 500 ground plane radials, and ground plane mount. Using one bolt to attach the ground radials to the ground radial mounting bracket. That's how you can tell a old original Hy-gain Penetrator 500 (Hy-Gain used two mounting bolts to hold the ground radial to the ground radial backet) to a Telex Penetrator 500, (Telex used one bolt) But still the Telex antennas worked ok.

The Products Safety Commission made CB Antennas pass a insulation high voltage test of 14,500 volts. This made a lot of the great old ground plane antennas that caused way less interference to neighbors consumer electronics, go away. Ralph Nader and his do gooders caused more TVI than anyone else combined.

Also the cost of the antennas manufactured by Hy-Gain or Telex, could be kept down quit a bit, due to their manufacturing mussel of incredo mass production. Hy-Gain and Telex also manufactured vast quanties of commercial and ham antennas, they effort for them to manufacture the Penetrator 500 was very small. The Penetrators might have been made from scrape pieces of aluminum tubing, left over from other antenna manufacturing jobs. But the market screamed for the Penetrator 500 in the CB Craze Hay-Days. So the manufacturing demand, changed the antennas design, to gear for mass production of the Penetrator 500 antennas at a very low affordable price. Just go out and try to buy the aluminum tubing from your local industrial metal supplier.

The aluminum cost will average right around $1 dollar a linear foot. The Vertical element is (ballpark close here) 267 inches long, or 22.25 feet. The four ground radials where 105 inches, or 8.75 feet long. Don't foget to add in the aluminum tubing over lapping inside each other. So the total length will be close to 60 feet, or more. So 60 feet plus all the running around, and you have a easy $100 dollars just in the aluminum tubing. I have rebuilt a few of the old Penetrator 500 antennas. I won't menation what the new insulators cost to be machined from Dirlon.

But the old Penetrator 500 really kicks ass, witout setting the neighbors TV on fire. Hope this helps.

Jay in the Mojave

Tom,

Don't know anything about the nightstick. But I use a Firestik
and love it. I have tried all kinds of other fiber antennas and
none worked for me as well as the Firestik does. I borrowed a
Wilson 2000 to see if it would be an inprovement over the
FireStik. There was no gain. Reception and xmit was as good as
the FireStik but not worth the price difference. The FS is easy
to adjust for SWR too. I am not connected with them in any
way...but I am impressed with their product and way of doing
business.

Your better off at a lower level (15W to get 60W PEP) unless you have had component changes to that radio's transmitter section. The stock final in that unit would be clipping at that 40W carrier level and you would have "carrier backswing" and therefor distorted audio... as well as overstressing the final transistor causing excessive heating and premature failure. However, you can attemp a moderate power boost buy optimizing the transmitter tuning sections. You should use a scope to accomplish this. Remember that although turning up the bias on the last two stages will have an effect on power output... it is not a good plan. This will cause excessive transistor collector currents and will heat the device possibly causing a thermal run-away (on sets with no doide bias tracking) condition and premature failure. Always try to tune your way to sucess first as this increases efficiency in the stage and may not cause additional transistor heating at all.

It depends on how long you wish to do that... and what is the ambient temperature. What will happen is that the power that the final transistor is attempting to deliver to a load (antenna) will be dissipated instead by the transistor itself. This will cause excessive heating and over a several minute period could be sufficient to destroy the final.

What's happening is that the metal cover is presenting a stray capacitance to the transmitter stage. It is changing the output tuning as a result. I suggest moving a metallic object in close proximity with transmitter inductors to zero in on the stage that is changing tune. Let us know what you find...

Wait a minute fellas! I've been running a 1011-D since 1977, and still use it today. It works flawless! After about 1 hour of warm-up, my VFO is rock-solid on SSB. I left it on 24/7 for about three years with NO problem. Re-tubed it twice since '77. Maybe I just got a 'good' one! Works GREAT with the Swan 1200-X amp too.

>yes, it would work. Now my radio is messed up and won't work and it is RS's
>fault. Can someone help?

RS has a 30 day money back policy, so you can get your money back for the antenna if you kept the receipt. As for the radio, are you sure it's not working, or is it not working because the antenna is faulty? Did you try using it with an antenna that you know is good? The only way an antenna could screw up your radio is if the SWR is high and you transmitted over it a lot. Can you still receive? Or is just the transmit dead? Make sure you keep the receipt, and check back with them to be sure they didn't sell you a ham radio antenna (2 meters or 440Mhz), or an FRS or GMRS antenna.

Actually, the best case scenario would be to use SSB and be very quiet while keying down.

That would be fine if it were a 2 pill class, if you had a class for every size amp it would be a long drawn out contest if you added these classes to the existing classes.

From: W5LZ <w5lz@oio.net>
Message-ID: <3918E8D9.B5B47EAE@oio.net>
Source record: 35063

b_helton,
Try this. Check SWR on ch-1, then on ch-40. Is there
any difference, and if so, which is lowest? If the ch-1
SWR is lower than ch-40, then the antenna is too long. If
the ch-40 SWR is lower than the ch-1, then the antenna is too
short. Adjust the 'whip' portion of the antenna accordingly.
If there is no difference between ch-1 and ch-40, I would
suspect that there is something wrong with the mag-mount
antenna.
If a mag-mount antenna will stay on the truck at 50 to
60 mph, I would say it is making a good enough magnetic
contact with the truck body to have a good RF ground. Unless
your runnning more power than is 'normal', a mag-mount should
work well. Do the 'check' in the first part and let us know
what you find.

Hi all.

I'm going to graduate soon, and I'm thinking of buying a Toyota 4x4. The first add-on I'll get for it will probably be a CB. I've been checking out the Cobras and Uniden radios, and antenna options.

Can anyone share an oppinion on the K40 and/or Wilson 1000 antennae? I have also read about some people using dual Firesticks, but have heard from a tech at ccrane.com that running dual antennae puts you at risk of burning out the radio, or at least getting _worse_ reception than a single Wilson or K40. Any thoughts on this?

Also, do people generally like the Workman Electronics roger beep boards?

If you have any advice for the installation, please let me know. Any and all help is greatly aprpeciated. :)

Adam

Buy a new radio if they are still available...
Keep the new radio and stick the old radio in the box you just got...
Then return the old radio as if it were the new one, and get your money back...
That way, you will have a new radio, and no hassle...

A farmer was helping one of his cows give birth when he noticed his four-year-old son standing at the fence with wide eyes, taking in the whole event.

The man thought to himself, "Great, he's four years old and I'm gonna have to start explaining the birds and bees now. No need to jump the gun. I guess I'll let him ask and then I'll answer."

After everything was over, the man walked over to his son and said, "Well son, do you have any questions?"

"Just one," gasped the wide-eyed lad. "How fast was that calf going when he hit that cow?"

>the K40 and/or Wilson 1000

The Wilson 5000 is only $10 more than the 1000. K-40's don't last as well. The Wilson Mag-mt WILL perform as well or better than anything other than a huge aluminum/copper antenna. It will definately outperform a 102 whip. Slap that magnet on the roof and ride, it will perform better on the roof than anywhere else.
The Uniden 68 is a great starter radio for AM, I'd look at an Eagle Sidewinder or Commanche Blackhawk for SSB.

Could anybody tell me if there are any magazines dedicated to CB Radio ? I have tried a few magazine sellers up here in Canada, and they either have nothing or they point me to Radio HAM magazines which do not include much (if any) CB related material.

Thanks,

Richard.

Although a 3:1 match is not great... you will have a very difficult time damaging your unit. However, you should try to better the match to at least 1.7:1. Where aer you attempting to mount this antenna... and what brand is the antenna?

Classic case of final oscillation. The cover is acting as a capacitor and when in place, causes an already unstable output stage to go into oscillation, usually somewhere in the 10 meter band.

The cure? depends. If the radio has been "modded to death" for every last milliwatt of power, it's a sure bet that one (or more) of those mods are the source of the problem. There is one common mod where the coupling cap between the driver and final is doubled with another. This usually causes the final to become unstable. Remove that "mod" and you. should be alright.

If the radio is bone stock, you have a tougher time, as I have never seen a stock radio exhibit this problem. I would check all chassis ground connections, and make sure that lead dress and parts orientation are not conducive to RF coupling.

Good Luck!

Actually the FT-101 series, had 11 meters on the bandswitch from the
factory up until the FT-101F. From that point the 11 meter crystal was
removed and the switch was changed to read "aux".

The 101 E should still have the 11 meter position on the dial. When I
had one, it did.

For $55, I was looking at the Uniden Pro-538w. Anyone have thoughts on
this radio? It has the basic stuff: rf gain, pa, instant 9, 3 weather
channels, and a front-fire speaker. It's really about all I want,
unless there is something you guys think a beginner can't live without.

No, it works because you have a guy that is cranking out about 500 watts in his stereo and all of a sudden that 500 watts is all channeled to his tweeters . It has nothing to do with the amount of power being put out by the tx. Before you express your doubts you should have a clue to what you are talking about.

No a ham did not do this. This was twenty years ago and I have had my ticket
less than 10. Only God knows why I got it. I thought it would let me do my

antenna research easier. The transmitter was legal at the time although the way I used it was not. I know I had to be within 20 ft of the guy to do my deed so I was not interfering with anyone else. BTW I've been on CB since 67 and my wife is hamm4fun.

They repeat to be heard above the humming, buzzing collection
of noise comprised of many US and Mexican CBers at once! <:

You think it's noisy over there...?

Mexican CBers turn every pot in the radio and never get it
back on frequency. Now there are many off-frequency Mexicans
mixed with many overmodulated US roger beeps!

thanks for the comments,

I tested the swr on channel 1, 19 and 40 through each magnet mount antenna and I get a range of swr values from just above 3:1 to 6:1 and 7:1 (if im saying this correctly). In general, I never get a swr reading below 5:1 through either antenna with the 68 LTW and the midland 77-113 will no longer receive or transmit on AM but will recieve on the weatherbands.

The magnet mounts are two radio shack base loaded models and one center loaded model. I need to find a better brand to begin with im sure, but I would like to try and get either of these to work before I have to break down and go buy another antenna. The antennas have no problem staying put while driving down the road and when I test them I have them installed to the center portion of the roof.

Another thing to note is that the magnet will only stick to the roof or the sidepanels, as the pickup bed and rails are all covered with a liner and the hood is made of aluminum. I have the same swr results on my S-10 pickup, so I'm kinda at a loss as to what could be wrong other than 3 messed up antennas or lack of a good ground.

Thanks again for your comments,

Brad

Soon I will have a guy climb up a tree to clean off some new up shoots that have sprouted out since the original base antenna install 5 years ago.

While he is up there, I was thinking of having him unscrew the coax connector, cleaning it etc. Is there something I can get to have him apply to the threads etc. for maintenance. I don't want to short anything out. If it's not necessary, I'll leave it alone.

Want to take advantage of the opportunity while he is up there.

Thanks

God, did they ever!

> Using one bolt to
>attach the ground radials to the ground radial mounting bracket. That's
>how you can tell a old original Hy-gain Penetrator 500 (Hy-Gain used two
>mounting bolts to hold the ground radial to the ground radial backet) to
>a Telex Penetrator 500, (Telex used one bolt)

Plus, Telex further cheapened the design by omitting the matching network at
the base of the antenna.

Truly a sign of the times. This was 1980, so America was struggling withn
Jimmy Carter's 13% annual inflation rate and 20% prime interest rate.
Companies tended to cut costs of production by whatever means possible.
Remember how bad record albums sounded around that time? The vinyl was so thin
you could see light through most of them!

I read the answer to this before, damned if I can remember what it is.
I also thought I printed the info for future reference, damned if I can find
it.
Please bear with me, and tell what the answer is.
I promise to print the info and try to keep it where I can find it.

Those antennas should provide a better than 3:1 match in practically
any situation. Are you sure you are reading the SWR meter correctly.
Most meters will not measure a 7:1 match. Are you sure this 7:1 is
not actually a 1.7:1 match?

Did you calibrate it correctly? Can you borrow another meter?

Yes, I was just going to say that myself!! I was in the U.S. Army over in Germany in 1990, and just bought a new Kenwood ts-440 and got my ham call DA2CR, and listened to CH 6 on a dipole, and could hear many stations on that frequency, and many east coast stations on SSB. Many of those super high powered stations can be heard loud and clear in Europe during the sunspot cycle peak years.

Robert

Agreed 100%, It is not uncommon for people in this country to
kill themselves with electric lawn mowers, all because they dont
use a $20 circuit breaker.

Cheers Mickey

I used an Aries Technology A-SWR 440 power and swr meter to check it.
The meter has black marks for 1, 1.5, 2, and 3 then is followed with
red marks of 5 and 10. When I take SWR readings after the swr meter is
calibrated then I get readings that are always between the 5 and 10
marks.I previously had the midland 77-113 and one of the magnet base
loaded antennas on a 2 door car with the antenna mounted on the trunk
and my swr readings were around 1.5:1. Just a very odd situation on the

pickup, especially since one of the base loaded antennas is brand new from radio shack. On that particular antenna my readings are never below the red 5 mark on the meter.

Thanks for the comments,

Brad

Very odd but there has to be an explaination. It sounds like you are
calibrating the meter correctly and reading the numbers correctly.

Therefore if we assume that you do not have a series of bad antennas,
and we assume that magnet mounts provide a decent ground, and we
assume the roof of a pickup is a proper mounting place.
Then we have to look at.....

1. Are you using a common piece of coax that may be bad for all the
antennas?

2. Is there a common obstruction to these antennas such as a camper
top that would interfere with the radiation of these antennas?

3. Is there a common SWR meter that could be reading incorrectly?

I suspect 3 Use another swr meter or use a 50 ohm dummy load and
see if your present meter reads 1:1 Then make a 25 and a 100 ohm
dummy load and see if your present meter reads 2:1

1227. Re: Whats the difference between AB1 & AB2 ???

As far as I'm concerned... there is only class AB. This bias is when there is a slight amount of current flowing in the output device. AB1 and AB2 may be someones idea of fine vernier adjustments of current flow for class AB.

Dont quite see the point you are tring to make. It is accepted
everywhere that the nine is the emergency channel. Here in the
UK that has always been the case and I for one certainly would
not modulate on it, simply because I have another seventy nine
to choose from.

Cheers Mickey

Source record: 34982

Linear in question: Palomar 225
Problem: Blew fuse every time I turned it on

Took it to CB shop and he replaced "protective diode" $20.00

Get it home, and it will now power up but wont transmit, and tx light wont come on when keyed.

Take it back, this time he says "finals need replacing"

2 weeks go by when I call and he says he cant fix it. Says he replaced finals and went through the whole board and checked all the lines and it has him puzzled. Then he says it may be the relay, but he's a Texas star dealer and for him to get one he would have to buy a minimum of 12 and didn't want to. He also said something about the relay checking out ok on his equipment but maybe the 8 contacts inside it are not all lining up at the same time? Then this truck driver in there says (as I'm leaving) "well did you take the cover off the relay, sometimes the contacts get carbon on them and you can clean them".

So..... Now I'm wondering who knows more, the "tech" or the truck driver? At least he didn't charge for this part and he said he left the new finals in it.

Any suggestions?
Thanks,
Ken
Texas

Each antenna has its own coax and the only possible obstruction is
small cell phone antenna about 2 foot behind the cb antenna.

I did check the swr reading once and it was around 2.5:1 but the power
reading only showed transmitting 2 watts. Now it shows 4 watts and 5-
7:1 swr. The thing that I can't figure out is why all of sudden the
midland would quit transmitting and receiving on AM but receive just

perfect on the weather bands.

I'll look for a dummy load and test it again.

thanks
Brad

Tim the deal is you nor anyone really knows what dave has done the past 15 years unless
you were a personal friend or a customer that has went to his shop just because you are
finally hearing about anything he has done is because of the internet ask 123 from "mowatts,
xfarce,etc" he personally has seen dave build these amps at least 3 years ago when he worked there.

knowing that prozac would make a big deal out of the amp was a perfect time to release the pics to him.

I am sorry noone let you know years ago that he has made them. Again dont take my word for it
look up Digger in Maryland he has Daves first 1 pill and 2 pill tuned amp.

OK, sounds about right. But what caused the fuse to blow..?

: Get it home, and it will now power up but wont transmit, and tx light wont
: come on when keyed.

Simple problem any good tech should be able to find.

: Take it back, this time he says "finals need replacing"

He's a hack! ... and doesn't know what the hell he's doing. Get your amp
outta' there and take it to a real tech.

I could find the problem in less than 1/2 hour. Any good amp tech can go
through these type of amplifiers without having to have the exact circuit.
I can and so can many of my amp friends.

If you email me direct, I'll give you some simple tests to try, save
yourself some money and a lot of bad solder blobs in your amplifier.

Bad relay contacts wouldn't keep it from keying for the most part. The
guy's a goof ball.

cheers
skipp@pilot.ucdavis.edu

first off i have yet to see any vehicle charge at less than 13.8 volts let
alone 12 volts
it would be impractical to run anything bigger than a 4 pill class since we
are saying a 12volt system is basically a stock one and would be kinda
stupid to run a
8 pill or bigger

They refer to the operation of a tube in an amplifier. AB2 means that drive power applied to the tube causes the flow of grid current. This means the tube is consuming power to amplify a signal.

AB1 is amplification without drawing any power from the source driver.

The way the tube is set up in the circuit and the type of tube you operate dictate what is the best type of operation.

A lot of triode tube amplifiers like the classic Heathkit (rip) SB-220 and SB-200 operate AB2. At full tilt boogie (drive), grid current is flowing. These "zero bias tubes" are classie AB2 operators.

Hi Ken,

They are a classic multi band tube radio. From the factory, they receive on 10 and 11, tx only on 10. It's simple enough to get them to tx on 11 if you wanted to operate there.

You didn't say if it was a plain 1011, the B, C or D version with the D being the last made in two versions.

If you bought it, you'd have to get it one time through an original Siltronix tech type or some mature electronics person with a little patience and a lot of experience.

After many years of operation, they need now to be cleaned out real good and some pm done to get it going right. The cleaning and alignment will do away with the drifting problems the unfaithful heathens spoke of. The final tube is a pricey item if you need another, but everything can be found. They make a killer ssb radio and a pretty impressive am radio.

Most anti Siltronix types are baffoons who didn't want to learn how to operate one right. A lot of these radios were killed by the magic screwdriver types right away.

Operation of a good working Siltronix 1011 is real close to heaven...

He'll probably get his $150 each for them, properly listed on Ebay, that's what I see them bouncing around for up there. I just bought my long sought after 1011B to complete me series collection.

Feel free to Email me if you have Siltronix questions. Not only am I an operator and tech, but I can tell you pretty much anything you want to know about them.

cheers

>From: SUGAPLAYER@webtv.net
> he claims to be geting 550 watts out of a 3 pill davemade

This is about right... but bear in mind that most of the hardcore guys in here will all be yelling about Bird watts and RMS...But the average CBer is usually just going with some type of peak meter so 550 is right

>wants to buy a 8 pill box that he can use along with 3 pill he was asing
>me should he get a davemade 8 pill

Might as well stay with the same maker...Besides the good thing about the Dave 8 pills is that they come in the same case as the 10-16 pills so it easy to add more pills later if you want to go even bigger

I hope I did`nt brain my damage.

I bought my FT101-EE (FT101-E without the speech processor)
new-in-the-box in 1975; it already had 11M on the bandswitch
and a crystal in the socket...and sure, I cut the brown wire
to enable 11M transmit. Sold it to a CBer in 1984.

IIRC, when 11M belonged to the hams, you could operate that band
full duplex on 'phone. I made a couple of contacts before it
went CB. 11 was never very popular before SSB and low level mix-
ers as it wasn't harmonically related to any of the other ham
bands and required a special VFO band operating somewhere around
the high end of 6 MHz (or Mc in those days).

I also owned a Yaesu FTDX-100, the forerunner of the FT101 series.
With all circuitry on one board, it was a nightmare to work on and
was never imported into the USA due to alleged patent infringement
and circuit similarities to the SBE SB34.

sniop

Impossible because the VFO frequency is three or four times the
standard VFO frequency. Theresfore with the same type of circuitry
and care of this radio you can still expect as normal a three to four
fold increase in drifting over a standard 5 meg VFO.

The use of this higher frequency VFO in the SlideTronics was done
to simplify the radio. However it was not without cost. You pay for it
on SSB with a higher than normal frequency drift right out of the box.

1260. Re: transmitting with no antenna

Greetings!

Well, the power level on the meter will drop to zero, or pretty close to it.

Then the Final will begin to heat up, along with the Driver. [There is a brief explanation below for further clarity of the "heat up" issue.]

Depending on the construction of the radio a separate TX transistor that controls the power to the Transmit side of the radio will fail. Acts like a fuse or thermal breaker, that is if the Final and Driver don't fail first.

When a radio "sees" a bad mismatch - it will attempt, first to

load into it, then jump down to a lower level of power. Because of the power imbalance, the current consumption is a lot higher thru the TX power switching transistor and if the manufacturer is good to their word, this part begins to drop voltage and begin to heat up faster than the Final and Driver. Eventually, this will cause the TX power line to quit because the smaller current-capacity switching transistor failed first - protecting the rest of the circuit.

If the Final and Driver pair don't go first, this power switch does [at least it should], and opens up - shutting off power to the transmit side and allows the radio to at least get receive.

If the Driver or Final fail first, it's a cascade event that can lead to a series of failures further towards the audio amplifier chip and the support/filter caps that provide modulation and current filtering. It really depends on how these parts fail, open - meaning blown fuse, or shorted - meaning molten silica and dead short from positive to ground.

Blown open - you're safe to a point, the Final and/or Driver can be replaced and you're back on the air.

Blown shorted, expect more to be wrong, possibly from a burnt trace to shorted caps in the modulation line to the Final and Driver section. Replace the Final and Driver first, to see if power can go thru. If not, look further into the Audio Modulation section, and even the audio chip.

It's at this latter [short] point, that the in-line power fuse will go. It can also be assumed, that both the Driver and

Final should be removed and checked - if one of these parts
dies as a short, the audio modulation transformer will also
heat up due to the current draw the short creates - and can
cause an open or shorted winding from the overheating that can

occur.

It is not uncommon to see a Final/Driver blow open within a few
seconds of the "no antenna - key the mike" situation. Why that would
occur, is to my understanding, when the Final can't handle the
reflected energy from the matching network [the section after the
final but before the antenna] and the energy developed between the
Final, it's tank circuit, and the network, quickly jumps to a very
high voltage and forces the transistor to exceed it's reverse
breakdown voltage and fail. In these cases, it's usually blown
shorted.

Greetings!

Nitestiks are from a Copper-based company.

Very similar to the Firestik but Firestiks use a logarithmic
wind versus straight top load.

Thats why you get the sales pitch.

Greetings!

Check both fuses in the power wires, one may have failed in the 77-113
power supply leads. Both are separate from each other and power the
radio separately - the memory wire powers the weather and audio chip,
while the Main Power supplies power for the CB radio side.

Also, how are you hooking up the power?

Try to use the fuseblock.

Try a short ground jumper from one of the radio bracket
thumbscrews to a known good ground - a screw to hold the
trim to the metal truss of the dash can help provide a good
ground while checking SWR. If this trick works, use this
jumper all the time - to help your radio and antenna maintain
a good SWR match.

Congrats!

>Can anyone share an oppinion on the K40 and/or Wilson 1000 antennae?

Both work, Wilson, In My Humble Opinion, is a favorite.

...[...]...
>have also read about some people using dual Firesticks, but have heard
>from a tech at ccrane.com that running dual antennae puts you at risk of
>burning out the radio, or at least getting _worse_ reception than a
>single Wilson or K40. Any thoughts on this?

You're describing a Co-phased antenna system, highly directional and
for it to work like it should, you need a phasing harness, two mounts,
and both antennas need to be kept separated at a distance of 6 feet to
9 feet for the phasing to work.

A single antenna gives you a better, omni-directional [points all
around the compass], antenna coverage pattern - works better for a lot
of people that don't care dore directional antennas like the co-phased
"twin antenna" types.

Plus, with all that gas/oil/insurance costs, that graduation money can
best be saved in utilizing a single antenna system for general all
around performance.

>Also, do people generally like the Workman Electronics roger beep
>boards?

I don't particulary care for Roger beeps, more annoying than they are
good. You're wasting money on something that can be invested into a
good antenna system and the radio instead.

At least, put an On/Off switch on the beep so you can
control the noise it makes.

It's my personal experience that Echos and Roger Beeps
make more enemies than friends.

Bob,
You can 'co-phase' almost any two antennas. But you
do have to do it properly. They have to be the correct
distance apart, the coaxial feed lines have to be the
correct length for the specific coax used, and you end up
with a bi-directional antenna. If you want to be able to
'switch' directions, you will need a coax-switch or a
remote coax-switch, and some more coax cut to the correct
length. If your chimneys are more than 18 feet apart,
you can't use them for antenna mounts. But it's still
do-able!

Brad,
If I understand you correctly, you got a reading of 3:1 on
ch-1, and higher readings on the higher channels. If this is
correct, then It makes me suspect that the antenna 'whip' it
too long. The 'fix' for that is to loosen the set-scrwew at
the base of the whip, slide the whip into the base further.
Did the whip go any further into the base? If yes, then do the
tests again. What were the results after shortening the whip?
If the whip didn't go into the base any further, if it was all
ready at the bottom, then you will have to cut the whip off a
bit (easiest to do with a grinder). Only cut about an inch at
a time (can't put it back, so small bites!). Try the test again.
Any change? if so, did SWR go up or down on ch-1, and ch-40?
If you don't 'see' any improvement, how ever slight, I think you
have a bad antenna.....

Tim,
Thanks but no thanks. I used to have a Swan (same
radio, differnt coverage) with a 2-speed main tuning dial.
Rear knob for coarse adjustments, front knob for fine
adjustments. ALWAYS had to have your hand on the front
knob or you'd 'drift' off the end of the band!
On second thought, what are you willing to pay for me
to take it off your hands???

Skipp,
It's not really the cleanliness of the radio, or the alignment that caused the 'heathen's drift'. It was the heat buildup in the VFO section, plus the wrong 'rating' for the capacitors (cheaper to build).
I do agree with you that they would make great collector's items! Clean'em up, put'em up there on that shelf...where they belong.

"wildcat (R-T Electronic's)",
Before you start in re-designing the radio because
of stage oscillation, etc, I'd take a real close look to
see if (as Hillbilly said) your not 'pinching' a wire, or
flexing the circuit board when the top is fastened on. It's
a lot more likely than some of the other suggestions.

Have never seen a 2510 but it sounds like the radio is going into self
oscillation. This self oscillation can occur if you tweak a stage,
usually a pre or pre-pre driver stage at one specific frequency. Try
to broad band your tweaking so that you don't over do it and cause
an instability.

Also, if my memory serves me correctly I can recall someone talking
about the case mounting screws or mounting bracket thumbwheels being
to long. They can come into contact with the circuit board. Don't know
what this will cause but worth a check anyways.

1304. Antenna Problems.

Newsgroup: rec.radio.cb
Date: 2000-05-10 00:00:00 UTC
From: b_helton@my-deja.com
Message-ID: <8fahormjv1@nnrp1.deja.com>
Source record: 35077

I have a Uniden 68LTW and Midland 77-113 and am trying to use a magnet mount antenna.

My problem is that I have been unable to achieve a decent swr, nothing less than 3:1 with each of the three magnet mount antennas that I have. I am unsure if the 1999 F150 truck that I am installing the radio and antenna in requires a "no ground plane" antenna style or if I need to install a ground other than the standard ground that the antenna is supposed to provide.

Also, what is the easiest and best way of grounding a temporary magnetic mount antenna system so that I will be able to use my radio without damaging it from the very high swr readings that I am obtaining.

That division of Hy-Gain is no longer around !!! I agree with jay on this one. I had that antenna in the 70's. It was the VERY best ground plane that I had ever used..plus at that time Wilson not Maco was making beams...I had the Wislon Y-quad then bought the Wilson shoting Star...Now same antenna different company!!!

How this clears it up for you...

Bill Eitner <kd6tas@netzero.net> wrote:

:> It often means just the opposite,
:> excessive modulation creating a lot of unnecessary splatter.

: You forget that the input signal dictates the
: quality of the output signal.

Not totally.

: With linear amplifiers, the amplifier cannot
: create "excessive modulation."

I did not say that the amplifier itself was the direct cause of the
overmodulation. The same is true of "non-linear" amps.

:> To me, endorsements by various individuals or winning "shootouts" are
:> worthless for determining the worth of a unit.

: I'm glad you're clear on what determines the
: worth of a unit.

: Unfortunately, not everyone agrees with your
: determination.

True. Whether that is good or bad could certainly be argued.

There are those that think the competition shootout amps winning means
that they would be the best for regular communication. It means no such
thing, only that they are the best in shootouts.

:I used to have a little tunable Fm transmitter that put out about 10 watts. I
:found that by modulating it with a 10khz tone I could burnout the tweeters in
:the offending stereo system. This concentrated all the power in the stereo to
:the tweeters. Unfortunately this only worked if they were listening to FM.

I doubt it. If that were the case, then all the tweeters in automobiles
would burn out when someone drove past an FM station - which has a much
higher power density at 1 mile than you would get with a 10 watt amp at
50 feet.

Professor <bgriffey@kwom.com> wrote:
: I'm very surprised at your stance... I don't believe a word of it. There is
: no set available that has that high an adjacent channel rejection!

Not CB. But there are Amateur radios that have it - if you are using a
narrow band CW filter. I don't know of any radio that will do so using
any of the voice modes.

Keep in mind that 10 dB over S9 is only 64 dB max. With the usual generous
S meters - it is closer to 37-40 dB.

A single antenna is a lot easier to make work. The longer the antenna the better. A magnet mount won't handle high power. Most people find roger beeps annoying.

I witnessed a car/lightning strike.... car was still running... driver was totally freaked out... looked like he'd seen God, but was OK.

Being inside the car, he was a part of the electric field and NOT a part of the current carrying path to ground (current is what kills... just a few milliamps will stop the heart).

The case of the electric line on the car is one familiar to me... my mother would've fried if she'd stepped out of the car she drove into a pole in '65... luckily , another motorist talked her into staying IN the car until Con-Edison could kill the lines laying across the body. (SCARY thought... sitting in a car with arcing wires writhing around!) I also knew someone who wasn't so lucky.... a Semi-drivin' friend of my wife died when he stepped from the cab to see what he backed into. The lines from the pole he hit were lying across the trailer... he was dead the instant his foot touched the ground as he stepped from the cab (luckily, his son did not leave the cab, and although he saw his Dad die, he's grown into a fine young man).

A point of interest... in China (and elsewhere I'm sure), High voltage trunk lines are inspected by a rider on a contraption that looks like a bicycle which rides ON the wires.... I'll pass on that job!!!

Tim,
Sure, an antenna tuner will 'fool' your radio into thinking
it's looking at a 'tuned' antenna, but, any mis-match present
before using the tuner is still there. If you can only have
one antenna, then a 'tuner' is probably the best alternative.
If you can have more than one antenna, your 'better' off having
a tuned/resonant antenna for each band.
'Doc

1320. Re: advice wanted on a mobile rig

Source record: 35093

Adam,
I can't offer any specific advice about your choice in
antennas, I do agree with Scott in that the longer the
antenna, the better off you are.
The technician who told you that dual antennas will burn
out your radio is 'full' of it, IF it's done correctly.
Dual antennas can/do work, but they're a pain to do correctly.
The primary reason for using dual antennas is that they
become bi-directional. Either 'in-line' with the two
antennas, or 'broadside' to them (depends on how they are
fed). Reception isn't really 'worse' but it is directional!
I aslo agree with Scott that the 'roger' beeps are a
pain to listen to. I don't need a 'beep' to tell me when
someone has stopped talking.
'Doc

PS - About the installation advice, it's always easier to
'over-do' the first time than to 're-do' later.

If your interested in AM only, Uniden PC-66, and PC-76. If you want sideband too, then Uniden PC-122, and Grant. Cobras are good too if you can get the pre-SoundTracker models, which believe it or not can still be bought retail.(a local truckstop around here sells the pre-SoundTracker Cobra 29 for $89.99)

For the antenna get good a steel toolbox. Mount it all the way forward in the bed.
Make sure it is grounded, then install a ballmount right in the center of the lid.
Then you can put any good center loaded or straight whip on there, and you will see better performance than a Mag-mount.

As far as the roger beep goes, save your money and get a channel mod, alot more useful than a beep.

Sometimes conditions allow your lovely USA CB to be heard over this side of the "pond". When this happens, I listen on AM mode around 27MHz and what do I hear? 40 channels of a humming, buzzing collection of noise comprised of many CBers at once on each channel.

Sometimes though, a lone signal will stand out many times stronger that any other, and what do I hear? A delightful American accent, but what the heck are they on?!! Is CB all about saying something over and over again, not so much spoken but almost singing? Repeating themselves again and again and again... what's it all about?!!

as far as radios go there are a lot of good ones out there it just depends on how much you are willing to spend .

and for the ant. try to stay away from magnet mounts the K-40 and the willson are both ant. that can be mounted solid but i must agree that longer s better, and for that reason i suggest the 102" steel whip it will out perform both the K40 and the willson in transmit and receive plus the price of a 102" whip generally runs at abought $17.00 dollars compared to the others.

Keep on keeping on.

Source record: 35253

Hello All:

I have been an avid scanner and shortwave user for quite some time. However, I have recently moved about 1.5 hours away from home...down I65.. and I want something to monitor in the car. I have read some others out there who have said that taking a scanner on the interstate is basically worthless for local action. You never know where you are in relation to the action, and by the time you find the local public service frequencies, you're in another area. After doing this for a few times, I would have to agree. Scanner listening over the road is boring.

On my last trip home, I dug up an old GE portable radio in it with a CB band on it for monitoring only. It just so happened that I heard about a long delay on 65 with truckers giving advice on where to get off and how to proceed. By pure chance, me having that radio saved me about 1 additional hour of sitting on 65. There was lots of other chatter on there, too. I was hooked.. and I wanted something a little bit better (that could also Xmit...what the heck!)

On to the point....

I got on Uniden's web site and got a Pro-350xl reconditioned handheld CB for about 55 bucks. It just came in today and I was messing around with it. It's kinda fun, but it leads me to some questions...remember...I'm NEW to the CB scene.

1. Do any of you have any opinions on this radio? It seems to be their top of the line handheld.

2. Am I pretty much going to have to get an external ant to get much use out of this in the car? Very few could hear me Xmit when I was in the car using the rubber duckie ant. I could hear others very well and the audio was good. However, I heard more when I got OUT of the car -- all of the time using the rubber duckie that came with it. Is there any danger (electrical) in using an external ant with a handheld in the car?

3. I could not get anyone to give me a "radio check." Do truckers and the like HATE that? If so, where can I find some pointers on CB etiquette?

4. Do you think a handheld in general is good enough for what I want to do? I really don't want a mobile unit, so if this won't do the trick, then I will send it back and just do without.

If I am repeating some stuff here, I am sorry. As you may or may not know, Deja is doing some work and most of the archive will be unavailable for several months.

Thanks.

Mike T.

Radio Shack has this little BNC-to-coax-to-suction-cup-mount extension
to mount your rubber ducky antenna against a window, or, if you own a
truck, on the outside of the back window. I haven't used one, but it's
only $12; Maybe it will help you until you decide you're really into
things and want to spend $50+ on a real antenna.

Steer clear of the K-40, I could never get a good SWR out of it, if you have to go mag mount go with the Wilson 5000. The better choice would be 102" steel whip. A great starter radio would have to be a Uniden Grant XL, works great has 40 ch am, upper and lower SSB. doesn't do too well at noise canceling but then again you will learn to compensate with the squelch. The radio is tough and can take a beating. I have mine peaked to 10watts AM and 15 SSB. I currently run a Wilson 5000 and love it.

Yaa Bill, Maybe the hole News Group would like to know. As I see it and I'm sure many other people do. Every time Professor responds to someone's posts he always trys to be as accurate and honest as he can. I think the problem is that he is very knowable and maybe a lot of people here are jealous of that. Some of you should take a good look back and see he never attacks unless they strike first. There is a lot, people can learn from you guys out here. Why not leave this News Group for what it's intended for instead of all this fighting and name calling. Yes I 'm guilty too. So as the saying goes (Can't we all just get along) We're on the side listening in.

I agree with you about the Wilson. They are one of the best antenna's out there for the money. You hit the nail on the head, nothing beats the 102" Whip for all out performance.

That's exactly what I did. I tried it with a spare mag mount antenna they had. All digits etc. worked, and it was receiving on all channels even with the mag mount sat on my lap in the car !! I did not key the mike though as the guy was not sure how good the antenna was or if it was faulty. Anyway, I paid my $50 and have taken my chance. We shall see how it goes.

Richard.

I tried using a handheld in a car once for kicks, but I soon found out I had to get a bnc/pl259 adapter to use it with a mag mount antenna to get it to even talk. You can get by with that.

Lots of folks would disagree with the idea that a Wilson is not as good as a whip. I use both. My personal experiences have led me to believe that they are pretty close in capabilities, but if I was to choose, I would take the Wilson by a large margin. Just seems to perform a bit better.

you took a good risk. there real nice sounding radios for a good price. there
is a kit that will give it 40 channels up and 40 channels down too if you
wanted. i had a friend in bermuda that ran one in his car with a wilson antenna
and sounded great here in texas almost daily.

what is a true blooded mexican???

perhaps you mean pure blooded spaniards or pure blooded indians? never heard of a pure blooded mexican though. i'm in texas too and i speak some spanish so i know most of what we here on dx isnt from mexico. just so youll know mexico and texas are too close to talk with each other on skip anyways except the occasional backscatter or ducting that can happen. maybe you hear some local people that are mexicans but the dx your hearing is south and central america.

1371. K-40 mag mount problem

Newsgroup: rec.radio.cb
Date: 2000-05-11 00:00:00 UTC
From: Dean Arthur <dearthur@silverstar.com>
Message-ID: <391AD350.362C@silverstar.com>
Source record: 35128

Somebody wrote:

Steer clear of the K-40 [mag mount], I could never get a good SWR out of it...

That's funny, I've swapped back and forth between the 11-meter K-40 and 10-meter HAM-10 coils and whips on a '89 Mercury Sable with trunk lid mount and lid braid-grounded to car body.

I've gotten good 60 mile contacts in Star Valley Wyoming with barefoot CPI-400 xceiver on 11 and intermittent contacts with bases and mobiles in New Mexico, Arizona and Alberta and points in between. I've gotten solid contacts from Wyoming to Texas and occasionally Argentina on 10 meters with 200 watts from Kenwood TS-520S.

I think the problem with the other fellow is in the wrist, always in the wrist. Twist it one way and the signal falls off the end of the antenna and electrifies the ground, driving the earthworms to the surface. Twisted the other way and all the signal goes straight up only to fall back to earth unused.

Star Valley is not all that easy to get out of with rf signals but we are happy to have minimal terrestrial and man-made noise to bear with inside the valley excepty on 11 meters. It is 45 miles long with floor ranging from 6200' ASL on the south to 5700' ASL on the north. Six miles wide on south end narrowing to 100 yards in middle at, fittingly named, The Narrows and opening to 4 miles wide at north end. South end blocked by 7200' ASL pass with mountains on west side ranging from 8,800' on the south end to 9,000' on the north. Peaks rise abruptly on the east side from about 9,000 feet on the south end to a set of 10,000+ peaks on the north end at Alpine where one makes his decision to go NE up the Snake River Canyon to Jackson Hole or NW past Palisades Reservoir to Idaho Falls, Idaho.

Maybe 5,000 people altogether in the winter [three seasons: last winter, this winter and next winter] swelling to about 15,000 with the snow birds and tourists in the summer. No taxis, buses or commercial aircraft nearer than Jackson Hole. Nearest railroad - AmTrak - service is Idaho Falls. Peaceful and safe with hiking, fishing, hunting and camping etc, etc. Unfortunately these features are so appealing that flocks of money-waving people have pushed land prices virtually out of sight as they have done in Jackson Hole.

1372. Re: advice wanted on a mobile rig

Newsgroup: rec.radio.cb
Date: 2000-05-11 00:00:00 UTC
From: IBM233@webtv.net
Message-ID: <19876-391AD767-24@storefull-211.iap.bryant.webtv.net>
Source record: 35129

The Wilsons and K40's are alright for the straight 40 CB frequencies. I have an Eagle Sidewinder which goes from 25 to 29.695 mhz. I needed a wideband antenna and only a full 1/4 wave whip would work. Thats why I went with a Francis 96" Amazer. Lastly, after I started using the Francis I began hittting stations (40 to 50 miles) barefoot, where as before (using a K40) I had to hit the amp to reach them. Thats just my opinion, I could be wrong....

Some Dow Corning DC3 SIlicone Dielectric grease is excelent for keeping out water and preventing corrosion. If you don't want to buy a whole tube of this you can get little packets of the same stuff at automotive stores. Its the grease you put in your spark plug boot. Forget what they call it. Then wrap the outside with a good vinyl tape and put on a final covering of coax seal.

>name .

Thank you!!!
Dave whenever he gets on the internet just simply laughs at most of the shit
that goes on here. He has NEVER and I mean NEVER had a web-site. Any web-site
that has davemade anything or sells davemade anything is just someone wanting
to sell dave's products. Shit even Brian Griffey could start a web site and
call it the Professor's Dave-Made site. Dave doesn't even sell the shit
anymore. He let's the guys that work for him do that!!!

Mine didn't. I lost an original (Hy-Gain) Penetrator due to storm damage and had to replace it with a Telex version. The new one didn't have any beta match on the bottom. This was in September, 1980.

There's an amp builder around here that puts his fans inside the box.
That keeps the resistors and transformers cool. It is important to
remove the heat from the heat sink, or thermal runaway can occur.

You said your fan was "on" the box, not "in" the box, and I was saying
that's a better idea.

I think Tim what they were trying to say is he does make 1 pills with transformers,and that he doesnt sell the "narrow band" (tuned amps) amps to the general public although he has been messing with them for quite some time, and perhaps they were giving you a timeline and some names of people to ask and confirm when they were indeed made.....

Oh!
Yes you are right scott it is better to have it on the outside like my m80 is.
However the best is to have a cooling system that incorporates both which I
also have on other amps of mine!
Cool the transformers... because they do get hot and
Cool the heatsink... because you know they get hot!

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't
mean a THING if you ain't got that SWING!!!!!!!

Hello TOO Many Radios: That's a neat fact to know. Telex must have changed the design somewhere. I have a Telex / Hy-Gain Penetrator 500 assembly instruction sheet that shows the Telex version with the Beta wires, and it is Copywrited in 1980. Must have quit a few different production versions.

He was pushing a different model a few years back, but
went low key for some unknown reason. Now all of a sudden
he's back and pushing a smaller version of what he was
selling before.
If I remember correct, Bill has seen one of his amps. I believe someone
locally bought one years back and Bill
asked to see it, but they didn't want to take it out of their
vehicle for Bill to give it a workout.

The Landshark

Hmmm. Maybe we are talking about two different radios. Are could there be two different versions on the market? My squelch has no outer control. The only duel control mine has is the RF-G/Mike-G lower left by mike plug in, and the clarfier which can be pushed in to change functions on the push button controls. My squelch is a single control. The manual makes no mention of duel controls here.

Perhaps we are talking about two different radios or different versions of the same radio? Magnum 257, right? Small little thing (to small for my liking but will work great in my small Sonoma truck). Mike so small you can almost pin it to your collar. (the damned thing gets lost in my hand and I end up pushing every button it has just trying to pick it up.)

Source record: 35205

if you have a 1.6:1 on channel 19 and a 2:1 on channel 40 then your whip is too long. You didn't say what your reading was on channel 1 but I would guess it is lower. If your swr reading on channel 1 is like 1.2:1 or something lower than the 1.6:1 that you were getting on channel 19 then you need to cut the antenna down more(1/8" at a time!). Even with a POS radio shack antenna I would think you should be able to get a flat swr reading across the legal 40 channels. Also I agree that the combo power/swr meter you are using is not an accurate power meter. You will find that almost nobody here agrees with what an accurate power reading is rms, peak, bird, dosy whatever but almost nobody will say that a cheap swr/power combo meter will give you a good indication of power. I am assuming that you didn't go out and spend a wad ($1000) on a big power meter and if you did I apologize for making this assumption.

Boswell.....

Bear with me....I'm new to all this.

I see people mentioning the "power" readings they get.

I was wondering....is there a meter on the market that will
measure power in the SSB mode? I see the tech. use one at a shop
I visit now and again but I assume it is a complicated
combination of oscillator and meter. Is there anything on the
market that allows the average CBer to measure SSB power?

I know most readings can be taken with a grain of salt anyway but
it would have to be better than the little thing I use which
normally gives me outragious readings.

This one had the clam shell shape ground radial and definitely had the top radials. I remember purchasing it from a cber turned dealer and would-be technician who used to be a pro football player for the Steelers in the late 60's or early 70's. He opened a shop and ran it out of his garage. He even installed the antenna for me at no extra charge. He did mess around with a bunch of home made stuff, so it is quite possible I ended up with a hybrid-type CLR-2. I bought it after a fellow op bought one and his signal went up a good 2 "S" units. Don't remember what he was running before that, but he told me where he bought it and I did the same. At least I always THOUGHT it was a CLR2 and others in the area that bought the antenna from other sources APPEARED to have the same antenna I did. Now ya' got me wondering. Back then, I never gave it a second thought.

1407. FS***RG-218 coax and vac.var.cap. for beam***

Newsgroup: rec.radio.cb
Date: 2000-05-11 00:00:00 UTC
From: KF6IKC@webtv.net
Message-ID: <7511-391B6C73-500@storefull-141.iap.bryant.webtv.net>
Source record: 35214
Cross-posted to: rec.radio.cb,rec.radio.swap,rec.radio.amateur.equipment

Here is just the set up for running BIG watts to your beam. 150+ feet of RG-218 coax and a 300pf,10KV vac.vari.cap. set up to take the place of your gamma match.Will easly handle 10KW DC at 28mhz. Will work 14-30mhz. rice is $400.00 + shipping from 96003. I can be reached at (530)241-0843.

Take care,
Stan

Gunsmoke,
Your right, it 'can' make them directional, if they are mounted the proper distance apart, and if they are 'fed' correctly. They probably mounted them like that because they wanted them to be directional(?), for use on the 'road', like the truckers.
All the 'directional' stuff about co-phasing antennas is really true ~IF~ you do it right. Most 'dual' antennas you see on cars and trucks are a waste of time. You can't mount two antennas the correct distance apart by mounting them on each side of a pickup... unless that pickup is 18 feet wide.
'Doc

Hello Twisted Hed: Sounds like the guy may have modified the CLR-2 into a Penetrator 500. This can be done easy enough, by removing the circuit board matching junk, and installing the Beta Matching wires.

A old ham friend down the road a few miles had a old 5/8 Penetrator 500 "look a like", I removed the cheap mickey mouse coils in the base insulator, and installed the Beta Matching wires, and after some tuning around got the SWR down to 1:1, and it would take all the fire in the wire all day.

The Hy-Gain CLR-2 was a significant improvement of the old original Hy-Gain "Golden Penetrator" that appeared in 1962 at a cost of 93 dollars. These first 5/8 WL antennas from Hy-Gain suffered from mechanical stress failure at the base of the antenna, which was supported by a single insulator at the base of the antenna. The then 200 inch in vertical length was just to much for a single insulator to hold in high winds, which broke at the base insulator and allowed the antenna to come crashing down, without regard to CB'er type of guy.

The Hy-Gain CLR-2 had a two point support bracket, with two insulators, one upper, and one lower. But the "Mickey Mouse" impedance matching coil, etched copper on a circuit board, just couldn't take any power. The Boys at Hy-Gain must have been really trying hard to cut costs. But the flood of complaints had to hit Hy-Gain hard, had to make the engineers hit the design boards again, to redesign the 5/8 wavelength ground plane antenna, to have the two point mechanical support bracket, and take heaps of power.

The Penetrator 500 was born. Hy-Gain used what they call a Beta matching system, that they still use today on all their beam antennas. The two element (Inductive L) impedance matching system allows the 5/8 wavelength vertical antenna to be matched in a optimum manner, where the single element, or single matching coil will not allow a optimum matching method. The Boys at Hy-Gain did their homework. But a significant improvement in antenna performance can be had by replacing the old #12 gauge aluminum wire, with a larger type tuning material, such as 1/2 inch aluminum tubing, and see a significant increase in field strength, by lowering the loss of the impedance matching system. I'll send you some photos of my New Design Mastodon 5000 5/8 wavelength ground plane antenna if you would like. Its a two point supported mount, with 4 ground radials, and a bullet proof 3/8 and 1/2 inch aluminum tubing impedance matching system.

Jay in the Mojave

SUGAPLAYER,
To start with, if he mounts his antenna on top of a
70 foot tower, his antenna will be 70 feet in the air.
The radiated signal from a vertical antenna comes primarily
from the base of the antenna, not the tip.The so called
'ideal' height above ground for an antenna is a minimum
of 1/2 wave length at the frequency being used. For 27 Mhz,
thats about 35-40 feet. Anything more than this is just
that much better.
He still may not be able to reach his friend 50 miles
away. Or, at least maybe not very well. The additional
height may not help, but it sure can't hurt! "There
ain't no substitute for height!", as they say.

Brad,
Glad you got things working! With the way you described how the other antenna was acting, it almost had to be the antenna.
Just a word about the readings your getting. Unless you've had your radio 'tricked out', your never going to get 6 watts out of a 'stock' radio, let alone 8 watts. The usual reason is that the SWR meter's input and output is not 50 ohms, and that causes all kinds of 'odd' things.

A body shop will charge about the same amount to repair a 3/4" hole as they would metal deep scratches, drill it and mount the Wilson 1000 or 5000 and all you have to do is to remove it unscrew the antenna and put the plastic cap in its place, it is very quick and east to remove and it is designed to do this. You will have better performance longer life and an easier removal, not to mention you will not have coax going thru your window. If you do go with a magnet mount go with the Wilson 1000 or 5000.

Source record: 35228

Redwire,
A lot of the confusion with power readings is that people really don't know what kind of meter they are using. Does it measure RMS, Peak, or Pep? Thats where part of the confusion arises.
You can measure power with any of these different kinds of meters. If you know how to convert from one type to another, you can express your reading in RMS, Peak, or Pep. But you do need to know what kind of meter you have. If you measure using a peak-reading meter, then convert to Pep using the 'RMS to Pep' conversion formula, the resulting power 'reading' is very impressive! It's not correct, but it is sure impressive.
If a watt meter has to have a voltage connetion for some thing other than dial lights, it's probably a 'peak reading' meter, and it usually has an RMS or 'average' reading position. If a meter doesn't need some kind of a power connection, it's an 'average' reading meter or RMS (probably the most common). The Byrd line of meters are all average reading meters, except for one model that uses a battery. That one is a 'peak' reading meter.
'Doc

1423. Re: Siltronix radios

Newsgroup: rec.radio.cb
Date: 2000-05-11 00:00:00 UTC
From: skipp <skipp@pilot.ucdavis.edu>
Message-ID: <Pine.LNX.4.21.0005112108530.1870-100000@pilot.ucdavis.edu>
Source record: 35230

Hi Tim,

It's all relative. There is no radio made that doesn't drift over a period of time. The Siltronix VFO drift was typical of radios made during that era. After a 1/2 hour warmup, the radio would stay withing 2KHz as the chassis stabilized.

After the total drift was measured, one could place a reverse temp comp cap in the vfo and it would pretty much stay in one place after that.

My old Kenwood TS-530 and 830's did that, Kenwood even sells the caps to do the comp job. That's where we got them.

Again, this is a tube type radio of which the chassis goes through a rather large temp range from start to stop.

cheers

The Autek WM-1 is an excellent value. It reads both RMS and peak.
Peak (PEP) power is the SSB standard. A powered, peak-reading
meter is required to accurately measure peak power. The WM-1 is
the best value in powered, peak-reading meters. Here's a link:
http://www.autekresearch.com/wm1.htm

Jeez you people are anal retentive or something. Heck, my radio is a bundle of wires and trasistiors and I still out key all the big boys in the tampa area... mobile or base. I have a 1.3 reading and my Connex is blastin 30 watts with my homeade internal modulator. 30 watts seems puny... but I am swinging up from about 1 watt. My Vanco power meter kicks some serious ass.

Coolaid Kid 213

I hear what you're saying... (and you're right my tube theory is weak) but isn't it true that the "classes" of amplifiers are the same for tube or transistor worlds? It all boils down to idling power for either the plate or collector respectively. The classes all have benefits and weaknesses... It's up to the designer to select the proper class of operation per the application. Enjoyed reading your post.

A DC fan is available from your local electronics store, car stereo place, or god forbid... Radio Shack. I really shouldn't bash the shack... truth is I have bought many a resistor over there on the weekend while building something. But anyways... easy to hook up to your 14V. What kind of amp do you have? How hot is it getting. What does it put out?

Remember that the soft piece of whatever... rubber, cloth... be as thin as possible. No more than say 1/16". I you go larger than that not only will the magnetic grip be weakened... but you may lose your ability to get an acceptable antenna match due to the reduced capacitance between the magnet (RF ground) and the car body.

You are more than correct 550 peak watts is right on money at 14-15 volts.

1440. Re: Antenna Problems.

Newsgroup: rec.radio.cb
Date: 2000-05-11 00:00:00 UTC
From: b_helton@my-deja.com
Message-ID: <8fd558jok1@nnrp1.deja.com>
Source record: 35270

Thanks for the info,

I rechecked the swr with the 68 LTW on the 36 inch base loaded magnet mount antenna and I obtained the following power and swr readings(the whip was all the way down to the bottom). Channel 1- 0.7 watts and 2:1 swr, Channel 19 - 0.8 to 1 watt and 1.8:1 swr, Channel 40 - 4 watts and 1.9:1 swr. I then raised the whip about 1/8 inch or so and obtained a reading of 4 watts and 1.4:1 on channel 40.

I also tested the 68 LTW on the 41 inch fiberglass base loaded magnet mount antenna and I got 3 watts with swr of 5:1 and 6:1 on channel 40 each time. With the 21 inch whip center loaded antenna I obtained a similar results as the fiberglass antenna. But I suspect the coax might be the problem on the center loaded antenna as it has been squished in a few places from coming into the doorjam.

I tested the Midland 77-113 with all the 36 inch base loaded antenna and received no reading on the power meter or swr during transmit. When the squelch is tuned up it still doesn't make any kind of sound. Only on the receive of the weather band. I suspect that maybe the finals are finished or something. It quit once before, but worked again, then just recently quit again. I checked the power supply fuse and there is only one 2 amp fuse going to the entire radio (no separate fuse for the cb side and the weather band side) but it is still good. So maybe it's time to give up on the Midland?

From: rgray@kc.rr.com
Message-ID: <67pS4.14868$_I1.135089@typhoon.kc.rr.com>
Source record: 35275

My Son-in-law bought a used RCI 2950 and when he transmitts on SSB he is garbled and the roger beep is a noise NOT a beep..I have the same radio 'cept mine is a brand new 2950 EX HD...we plugged it in on my moblie using the same power cord my radio does and of course antenna..still sounds like crap..

I have a couple of ideas from "listening" here on the news group.....first off thought the non-factory power cord might be the problem (it appears to be the same wire gauge as mine however)...or who ever set it up did so for AM and is driving the heck out of it with modulation...or the 8 voltage regulator is freaking out...

On AM he sound overdriven..but clear beep...on SSB sounds garbled and the roger beep is more of a hiss rather than beep...

Thanks

Ron

Yeah, Swan built the 1011C - it was the CB version - and cheaper.

I have a 700CX. While it has a slight amount of drift, it is not any
greater than other radios of that time.

It was nice having about 700 watts PEP available in a box the same size
as the other ham rigs on the market. Pretty basic bare-bones rigs,
without AM.

Doesn't that fact that all Siltronix owners, friend and foe, all
agree that you must keep the radio on all day long suggest
anything to you?

Don't they keep the radio on all day long to allow the VFO to
stabilize on one frequency? Don't they all realize that the Sil
more than any other radio of this era and type requires this?
Don't they realize why?

The use of this higher than normal frequency in the VFO was
done to simplify the radio. However it was not without cost. You
pay for it on SSB with a higher than normal frequency drift right
out of the box.

This same warm up drift also rears its head when you start
transmitting. The VFO compartment will get warmer after a
while of transmitting. This will start the ready to go VFO
drift again

I installed one in my old van and adjusted it to around 15 watts
am.... it has varible power and I keep it at about 10. so far
seems like a good rig...really good audio reports. super clear

Save your money and get a real radio. You will eventually be disappointed with the handheld, and will want something bigger. The way I look at things, if you are going to buy something, buy the best you can.

1465. Re: Whats the difference between AB1 & AB2 ???

Newsgroup: rec.radio.cb
Date: 2000-05-11 00:00:00 UTC
From: Richard McCollum <rmccoll@radiks.net>
Message-ID: <ydxS4.886$H63.3053@newsfeed.slurp.net>
Source record: 35295

That's because you don't work with tubes, Prof. The 1 and 2 make a distinction between keeping the grid negative (AB1) and driving it positive (AB2). Class A is always 1, Class C is always 2, B most cases is also 2 so only in AB operation is there any difference that isn't already understood.

The distinction becomes important because 1 operation requires only driving voltage where 2 operation requires power from the driver and sometimes causes some headaches when the amp makes the transition into grid current at the upper parts of the input cycle, kind of like a pusher prop transitioning from the dense air below a wing to the low pressure above it. If you drive a grid positive it draws grid current and electrons from the cathode; if you don't provide the grid a dc return path those electrons will quickly drive the grid so negative that electronic constipation results. In tubes, the distinction between AB1 and AB2 is of some importance.

With bipolar transistors, base current is what makes them work so everything is 2. So if you are only interested in transistors, everything is understood again so there is no need for the 1 and 2.

Make any sense??

Dick

Hello Too Many Radios: I didn't know that they did away with the beta match wires. I have two old Telex Penetrator 500 antennas in parts, they both have the beta matching wires.

Hy-Gain in the mid 1960's came out with their CLR-2, it came in 3 and 4 ground radials, and had two small coils or chokes as the impedance matching system. And of course all the Big-Straps burned them up. So the Penetrator 500 with its 1500 watt power handling capability took its place.

For ease of operation, I'd stick with the Wilson 5k. Change coax to Times LMR240. If you disassemble the antenna, you'll see how the coax is installed. You'll have to use a dremel to open up the coax exit in the plastc housing of the magnet.

It has nothing to do with profit. In testing of a vehicle's rooftop, the Wilson 5k handily outperformed the 102. That is what I've found, sorry you disagree, but that's ok!

Message-ID: <JeFS4.51708$g4.1428818@newsread2.prod.itd.earthlink.net>
Source record: 35307

Just bought a 148 gtl with soundtracker yesterday and a 140 gtl today (pawn shops). The 148 is like new and the 140 not so new.
So my buddy was telling me a lot of cber's talk negative about the s-tracker models, and that he had a 29 with st and didnt like it .
When I pinned him down on why, he said because it stayed on constant (feeble).
Mine has a button to turn it on and off and it does what is says, cuts out the noise.
Then I see comments here like "get a pre-soundtracker cobra".
Whats up?
They both work equally well.

Ken

I have heard that putting cling film under a mag mount antenna will help stop it marking your car. Is this true ? Does this extra gap (although miniscule) affect performance in any way ?

Could anybody recommend a mag mount that marks the paint less than others ?

Thanks,

Richard.

Unfortunately there is no such thing. All magnet mounts will scratch the paint. My recommendations would be to just leave it on the car. If you must take it off, make sure the area is clean when you put the mount on and always try to lift up instead of dragging it when taking it off. It will not affect your performance by putting something between the mount and the car body. I used a thin piece of rubber on a Wilson1000 it does work great, but I noticed that the strength of the mount was greatly reduced. Sorry I couldn't be of any more help to you. We're on the side listening in.....

If you plan on removing a magmount often then there is no way of
stopping scratches. But if you want to leave it on then try this.

Get some Johnson Paste Wax and smear a liberal coat on the paint
below the magmount spot. Place the magmount on top of this still
wet wax and then use your finger around the base of the magmount
to create a seal. In other words use the wax like it is caulking.

If you don't want to get the wax on the magnet then just wrap the
base of the magmount with aluminium foil first. Then place the
magmount on the wax. And then trim the exess foil by simply
tearing it away from the edge of the magmount. Seal as before
with the excess wax.

Although this will stop particles from getting under the magnet and
thus stop scratching the paint, it will not stop the rest of your
cars paint from fading in the sun. If you remove the magmount
after a couple of years you will find a darker paint spot under
the magnet.

1487. Re: Newbie Questions and Opinion Wanted on Pro-350xl

Newsgroup: rec.radio.cb
Date: 2000-05-11 00:00:00 UTC
From: "Michael B. Tinsley" <mbtins_nospam@mindspring.com>
Message-ID: <8ffan7$92o$1@slb1.atl.mindspring.net>
Source record: 35317

That was going to be a follow up question. Is there any danger in getting one of those 259 to bnc adapters and using it? I assume not since you've done it.

Also is there any danger in using an external mag mount with a handheld? I.e. from standing waves and the like?

Thanks.

Mike

No one has an opinion on that particular model, though? Or does no one on here use it?

Virtually all handheld CB transceivers are worthless for communications beyond a mile or so after you write the check. Take a look at the fine print and see what the output is and you will better understand. If you already have a handheld, do the best you can with it--otherwise put your money into a mobile. The cheapest mobile will outperform the priciest handheld.

2000 Toyota Tacoma 4x4 Extra Cab with Wilson on top of cab, cut cellophane to size and put it under the antenna the day I brought it home. SWRs were not affected and I haven't removed it yet. Whether it assists in protecting the paint still has to be determined. Running any type of power will definitely leave it's mark over time utilizing strictly a mag mount.

Cliff,

You are exactly right! I had a Swan 700CX. I would warm up the filaments for about an hour if it had been off. Never had any trouble with drift once the thing was warmed up. I have a 101ZD now, and guess what! If you turn it on and start talking, you'll be all over the band! Warm up the filaments and it is very stable. Swan/Siltronics are no different. When the solid state guys don know (?)is that ALL tube rigs need to be warmed up for max. stability.

Richard,
As the other 'posters' said, there's really no way to stop from getting mag-mount 'scars'. All of the suggestions help, but they won't stop it completely. Along with the rest, you might try removing the antenna regularly. Clean off the mounting spot, keep it waxed and clean, along with the bottom of the mag-mount. Using the 'Saran-Wrap' next to the paint, then 'ArmourAll'ing' the bottom of the mount might help too (but I doubt it).
'Doc

PS - If you do find a way to stop the scratching/discoloration, we can patent it an make a fortune!

spikey,
If I'm understanding what your saying, then yes, it
can be done. To retro-fit this to a radio is going to
take some circuit re-designing. How much depends on the
radio, and is probably not worth the effort(also illegal,
by the way).

The soundtrackers are alright. The soundtracker doesn't really work and if you want to up the wattage on one, expect maybe 10 to 13 watts. The old Cobras can get up to 30 watts. Their modulation is a lot better. Get rid of the soundtracker.

1507. Antenna Problem - Solved for now

Newsgroup: rec.radio.cb
Date: 2000-05-11 00:00:00 UTC
From: b_helton@my-deja.com
Message-ID: <8ffg2e$7uo$1@nnrp1.deja.com>
Source record: 35337

I went and bought another center loaded antenna from radio shack and it seemed to have solved the swr problems. On channel 19 I'm now getting 6 watts output at 1.6:1 swr and channel 40 - 8 watts @ 2:1 swr with the 68 LTW radio. Those values were obtained by cutting approx 1/8" off the whip.

Thanks for the help to all who posted to my previous message

Brad

>whip.

Just a note: When measuring power from a typical SWR meter do not
believe the indicated wattage unless you have a perfect 1:1 match. It
will not read correctly without this proper 1:1 match. It could,
depending on the impedance of the antenna, read to high or to low.

1516. Re: what is the best 5/8 wave base antenna?

Newsgroup: rec.radio.cb

Source record: 35346

Hello Twistedhed: Is it possible you are mistaken about the CLR-2 Antenna? Did your antenna have the external matching wires?

The Hy-Gain CLR-2 Antennas, did not have a good impedance matching device. The impedance matching matching device was a circuit board 1.4 inches in diameter, by .07 inches thick, that fit into the (injection molded) plastic base insulator. The impedance matching device was a very small copper trace in a coil form, on the circuit board material, that was .035 inches wide and approx. .010 inches thick. Most all CLR-2 antennas would burn out this "Mickey Mouse" type impedance matching coil on a circuit board with the least amount of power.

Also someone out there made a 5/8 Penetrator "Look a Like" that had 4 ground radials, was about 22 feet high, even had the same "Clam Shell" type ground radial mounting bracket. But this look a like Penetrator 500 did not have the 4 Top Hat Radials, or the Beta Matching wires. It used a pair of cheap or inexpensive chokes or coils to match the impedance's. These coils were also installed in the base insulator. These fake "look a like" Penetrator 500, are very easy to identify, the mounting bracket is 11 inches in length, and the Hy-Gain or Telex Penetrator 500 had a 12 inch mounting bracket.

Another outstanding point was made by Hamm4fun, he said:
>There are basically two types of 5/8ths, those that had wire wound >loading coils at the base to match them to the feed line and those that >used some other method. The ones that used the coils were garbage. >Whatever gain that was to be had from using a 5/8ths the coils took away >and they could not handle power. I belive the Penatrator had kind of a >looping piece of aluminum tubing in place of the coil and was one of the >better antennas.

I have measured a few of the original 5/8 antennas, and have detected as much as 6dB loss in the matching devices.

Thanks again Dave, hate to bug you with this again, but
externally the squelch control is in the upper right hand corner.
Does it work in conjunction with the func.? Are am I reading you
all wrong.

Or did you mean upper right hand corner inside the radio?

I have one (maybe more if I like it) that (can or will be) given
to me in payment of a debt. It is new in the box and opened for
CB freqs. But I think the shop owner told me he had it set for 4
(or did he say 7?)watts on AM because he always sets them up for
use with an amp. I have an amp but the truck I want to put this
one in doesn't, so I was going to run it barefoot. (or sell it).
So if I want to crank the output up on AM what do I do?

Thanks

This radio uses an 11.1125 MHZ crystal and normally pin 10 on the PLL is grounded. If pin 10 is cut free, the low frequency will drop to 26.365 or there about. To get high frequencies without using an Expo kit, change the crystal to 11.3258 MHZ. I used to order the 11.3258 crystals from Uniden. (They were used in the Madison).

Just bought a brand new base- a Prostar-497 (basically an Eagle Tomahawk) , a new Antron 99, and a new TUP9 D104. Woo-hoo, right? Well, my tech converted, tuned up, did everything for me except wire up my new D104 for this base... help! I did as I is written in my paperwork (as listed below) and it receives but when I try to key up, I get a squeal and it keys for about .5 seconds, so it's obviously not correct. Anyone know the correct wiring for this radio? I have:
1- Audio (White)
2- Sheild & Blue
3- Red (TX)
4- NC
5- Black
... where am I wrong? Thanx in advance!

Tinker (558 in the Empire State)

Let me answer my own question... via trial and error, and a bit of logic, the black and sheild/blue were switched. (which of course is why it received, but no TX)
The new setup works great! All the features are a nice change (memory channels, almost 25-30 Mhz range, etc) and for 169$, I couldn't beat it.. :)

1535. Bean + Alternator ?

Newsgroup: rec.radio.cb
Date: 2000-05-12 00:00:00 UTC

Message-ID: <EIDPwFAmp9G5Ewc6@invest.fsbusiness.co.uk>
Source record: 35165

Bean,

I believe it was yourself that put me onto that alternator didtributor in Cincinnati.

Well, their site is pretty good but they don't like answering e-mails price requests!

I telephoned a gentleman there who was also lacking in the help department and my trip to the US is but a few days away.

I really would like to pick up at least one 350A+ unit to ship back here to the UK.

If you know anyone at this place can you pass over their name and I'll call again?

Best price on one or two new or properly reconditioned E350-12 Electrodyne, C712 Niehoff or a 2270 Leece anyone?

All must use external reg and rec.

I'll be in OH from the 17th of this month and will then drive down to Tyler, TX after Dayton.

Phil / UK

>MY NEIGHBOR HAS A IMAX 2000 AND HE HAS IT ON A 50 FT
>POLE.NOW HE HAS BOUGHT 7 -10 FT. SECTIONS OF TOWER AND PLANS ON
>MOUNTING THE ANTENNA AT 70 FT AND THE LENGTH OF THE ANTENNA IS 24 FT.

From 70 feet, line-of-sight to the horizon is 13 miles. (Square Root of the the height X 1.415)

If the friend with the beams is at 50 feet, HIS line-of-sight is 10 miles. At 27MHz, it is possible for the signal to "bend" over the curvature of the Earth to give even greater distances. You have to take into account the location of both stations, relative to the surrounding area. Is one of them on a hill? That adds some distance to the horizon. Is one in a valley? Uh-oh. That will subtract.

Fortunately, CB signals "bend" more than VHF/UHF. For many years, I operated a 10-Meter beacon station running 8 watts. The antenna was an A-99 on a 39-foot pole. The site was at 500 feet above sea level, which was 75 to 100 feet higher than the surrounding area.

In a car with a Wilson 1000 antenna, we consistently could hear the signal 46 miles away. We had reports from cars 55 to 60 miles away. Base stations, of course, could hear the signal much farther.

Source record: 35173

The Texas Ranger Base is NOT anything like a 148 chassis. It is an fcc approved version of the "6900/696" type board. This is the same board used the Galaxy DX-959/949 & TRngr 69X & 39X mobiles (the 296 mobile has the 148 board). Features include roger beep & variable talkback built in. Most people find that it can be made to "peak up & swing" much better/easier than the 148/Grant XL chassis, & it also has a spot labled & waiting for the "Xtra final", & "channel mod for the 8719 is easy but very Different than the 148 mods.....

1549. Re: Magmount Antennas - How to stop them marking your car ?

Newsgroup: rec.radio.cb
Date: 2000-05-12 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <MLTS4.51280$x4.1757032@newsread1.prod.itd.earthlink.net>
Source record: 35179

Well, I see you got the SA suggestions about getting rid of it and drilling a hole. But don't rule that out! When I traded a car, I had an NMO mount in the middle of the roof. I casually asked the dealer what that 'cost me', and he told me ZERO. So it's not as bad a suggestion as you think. And if it's something like an NMO mount, you can get all kinds of antennas for it, like cellular, HAM, or CB, depending on what you want down the road, or if you sell the car. A PROPERLY installed NMO mount could actually be a plus.

But on the mag mount issue... Larson makes mag mounts with a nylon sheeting over the foil. (The foil is used to increase capacitive coupling to the car body. Does it help? I'm sure it does, but by how much is up to opinion!) But the real issue is dirt and grit getting under the mount, and then movement scaring the surface.

You can keep the car clean. You can take pains to always 'tip' the antenna to put it on and off. And you'll STILL have scratches in the long term. If nothing else, someone will pull on the cord and drag that mount right across the roof...

But you can minimize it by keeping the surface clean and waxed.

If I talk a car that normally doesn't have an antenna on it, and use a mag mount, that's totally different than leaving a mag mount on for daily use. I leave a mag mount on my Jeep Wagoneer. When I was married, my wife had fits if I left an antenna on her brand new Caravan. (She'd be out there washing and waxing!)

For those occasional uses, I would always wipe the surface clean so I don't 'grind in' any dirt and grit. And when I went to place the antenna, I'd put down a square of waxed paper, then 'tip' the antenna onto the surface. I'd replace the wax paper every couple days, or after any rain storm. This will cause a hard wax spot to appear on the car paint, but it won't last once the antenna is removed.

Cling film?? I'd suspect that would be worthless. It's too thin unless both surfaces are perfectly clean and smooth to begin with. And if they are both perfectly clean and smooth, why put the cling film to begin with?

Mike

Thanks for the info. Jay. As I stated, when attempted to take the thing down, it broke apart. Don't remember exact details but I do remember the base area near the ground radials is where it "snapped" like a twig when I
loosened it and tried to separate it from the mast. It was a great antenna and never had any problems of any kind through the years of wind, snow, ice, and summer heat. Also remember the guy messing around for a few hours with his meter and constant adjustments 'till he got it "right". This was my first base antenna and I was just being introduced to the technical aspect of antennas and SWRs. At the time it might as well have been Arabic 'cause I had no clue as to what was happening. Yea, I'd like to see the pics of your antenna. And then I'll probably pepper ya' with questions. 3s.

This is kind of what I thought also kpredwolf. No offense AB7, but where have you researched your info? I have read discerning opinions among solar scientists this year, but the most reliable source is the Royal Observatory of Belgium, who is the world's official keeper of sunspot records. According to them, the density of ionization has increased most rapidly this year and sunspot 23 has set a few median mean records of it's own.

it is not a high drive amp. i've been looking for one my self for quite sometime without any luck. if you want to sell it let me know. these are no power houses by anymeans. you should run it with a 30 watt dead key. no more then that or youll sound bad and stress the power supply.

1569. Cobra 140GTL (MB8719) PLL Question.

Newsgroup: rec.radio.cb
Date: 2000-05-12 00:00:00 UTC
From: oneqck76ta@aol.comSpAmSuX
Message-ID: <20000511200201.19952.00002204@ng-bd1.aol.com>
Source record: 35242

I have a cobra 140GTL with the MB8719 chip and I can only get the lower (below ch. one) channels in it by connecting pins 11 & 12. I cant seem to get the upper channels by grounding pin 10. My Grant XL and 148GTL (Same PLL chip) get both upper and lower. Is there a certian way (Like cutting a trace) that I have to ground pin 10 or is it a ver. of an older chip?? Any help would be great. Thanks in advance.

P.S. I saw on a web site that said the older ver. were differant and could only get certain channels. Saw it a long time ago and not shure where. Thats why I am asking this. Thanks again.

I found the web site that stated that there are differant ver. of the MB8719 chip. The address is http://www.superior.net/~haggis/pll1.html

Below is also what is printed there on the web site. Sorry for copying this if it is your web site.

MB8719/MB8734

Models Include:- AM In-dash Models:Cobra 46/47XLR, 50/55XLR.

Single Conversion AM/SSB US models:Cobra 140/142GTL, Courier Galaxy, Midland 79-900, President P400/Mckinley/Washington(new), Realistic TRC450/TRC490, Robyn SB505D/SBE LCBS-8/LCMS-8, Teaberry Stalker IX/XV/XX, Tram D80/D300, Uniden Washington.

Dual Conversion AM/SSB US/Australian Models:Cobra 148/2000GTL, Pearce-Simpson Super Bengal MkII, President Grant(new)/Madison(new), Uniden Grant/Madison.

Multimode AM/FM/SSB Export Models:Cobra 148GTL-DX(early,PC879), President Grant(export,PC899), President McKinley(export), Stalker 9-FDX(PC893), Stalker XX Export

The MB8719 is used in the popular Uniden chassis.In the Export versions it has a pair of MC14008 binary Adders connected to it, this enables more Ncodes per mixing crystal.

Modification can be done by changing the loop mixing crystal or controlling pin 10 on the MB8719.If the MB8734 PLL is fitted, replace it with the MB8719 then pin 10 can be controlled.

Also, I can't get anything to happen with pin 10 like it says.

Another Web site (I think it was Homers cb mods) said to cut the trace at pin 10 and put a switch there. Tried that with no results.

I tinkered with it a bit more and it now registers 4 watts on all channels. And to answer the meter question, no. I bought a meter whose sole purpose would be to give a swr reading and help in tuning the antenna. I ran a extra ground lead from the cb and I am now getting an swr reading of 1.3:1 to 1.4:1 on channels 1, 19, and 40. The range is much better so I'm content. Once I have a larger budget I'll tack on a Wilson 1000 or 5000.

ok take your basic dosy meter , it read output watts , don't matter if the watts are fm , am or ssb .

all that fancy stuff you don't need .

no meter save maby a really expensive bird meter will give you a true reading

a 100$ dosy meter will do fine , they usually measure watts , swr and modulation.

hope this helps

Source record: 35351

I e-mailed LTD and asked about the two different versions...here
is the answer I got back.

Good morning
The M-257 like all products manufactured today comes with the
proviso
"Prices and specifications subject to change without notice".
The factory
produced this radio for over 2 years as a fixed 30 watt
transceiver. The
factory decided to add the variable power feature, they did not
change the
price nor did they advise any of their customers of the
change. Actually
our initial shipment of variable radios was mixed between fixed
and
variable. Since your comments are the first we have had on this
subject. I
will inquire with the factory to see if the new front panel
board is
compatible with a fixed radio and what the cost is for one of
the boards
and new front panel and let you know.
Thank you
Sam Lewis

I can't believe nobody mentioned the Uniden Grant XL....by far
the best most dependable legal rig on the market today. its the
older version of the 148 made in the phillipines. the washington
is a OK rig but it is only a single conversion reciever and a
dual or triple conversion would be much better....

dave

SUGAPLAYER,
For an antenna to act effectively, it should be a minimum
of 1/2 wave length above ground. At 27 Mhz, a 1/2 wave length
is about 35-40 feet. Anything more than that is just 'gravy'!
Everybody can't get an antenna that high, and an antenna will
certainly work well below a 1/2 wave length too.
Just for 'grins', if his antenna is on top of a 50 foot
pole, his antenna is 50 feet high. If it's on top of a 70 foot
tower, his antenna is 70 feet high. If you intend to 'measure'
from the most effective part of a vertical antenna, you measure
from the base. Adding the antenna's length to the height above
ground may make it sound more impressive, but it isn't very
smart.
'Doc

I have the standard PLL hack 6-position rotary switch 26.815 - 28.045. The crystal has been changed to 11.3258. Would it work to install a crystal switch between the original 11.1125 and the 11.3258 to get lower than 26.815? How does one overcome the broadbanding problems associated with the VCO and the rest of the radio?
thanks!

>
>i drive my two pill with my radio ..... duhhhh
>

Then you do not drive it properly!
Why else do you think the 3 pill was created???
You can get by with the way you do it, shit you can drive a 4 pill with a radio but, the issue is you are not seeing the watts that you are supposed to. The best way to test out what I am saying is to get a straight 2 pill and a 3 pill (1)2290 X (2)2879 and use whatever meter you can obtain. Us your radio and key the 2 pill check what watts it swings to when you talk. Then put in the 3 pill and do the same thing and see where it swings when you talk. Write these watts down for later reference. I am positive that you will see more watts out of the 3 pill. Why??
Because you are driving the (2) 2879's much harder!!!
Comprende???

> 'Doc

Doc, as a ham you should know better, a 1/2 wavelength at 27 mHz is approximately 18 ft. Also that ground is RF ground which is not necessarily and probably not earth ground level. RF ground my be several feet below the surface. So an antenna at a height of 50' above earth ground is and not necessarily 50' above RF ground.

I dont suppose there is much chance of picking one of those up
cheap at the Luton and Dunstable Rally on Sunday!

Cheers Mickey

thanks to all the good folks and all the e-mail support.
the problem with the hr2510 is solved.
just to bring you guys up to speed on what happened
with the top cover on the radio it dead keyed 40 watts with no swing
or mod. after all the pin point test all the try this and try that i
have found the problem. to let everyone in on this problem should you
ever run across this in the futher , the radio has 2 cermaic green
cap's soldered across the driver transistor , remove and replace
problem solved.

have a good weekend and 73's to you all

>
>
>
Hello ron the problem you have sounds like someone clipped Q32
transistor, now this will open the mod up also but its is the wrong
one to clip. to open the mod on am only clip R291 insted and replace
Q32. the power cord for that radio must be the 14ga type with 10 amp
fuse
if Q32 was clipped the radio will over mod on am and sound very
muffled on side band and the roger beep will sound fuzzy.
hope this helps you out.

This New Group is the best. The people on here are a bunch of real winners. I have never seen a group of dumber people in my life, wait yes I have on the CB. You people fall for anything out here and know nothing. Well I will say one thing about this newsgroup it's certainly cheaper then buying a lot of equipment and installing it in my car. If I could get an intelligence level reading out here like an SWR reading I would get something like 3.1 or worse. I come back for one week and things are still the same. I would love to know what some of you people do for a living or better yet a life. I would give 2 to 1 odds most of you can't even read or write...LOL. Give me a shout sometime if you know how to key the mike. We're on the side listening in.

Do I consider myself a "Peope"? Just in case I'm one of these Peope's,
I'll try to answer at least some of your questions, and perhaps delve
into various other issues which may be of interest to you. For a living,
I design corporate websites, and I also have a small side business
wherein I design web graphics & promotional material. I can read; I can
write. In fact, I used to be assistant editor of a magazine, and still
write occasionally as a freelancer. I also play the drums. I do not
speak with a Southern accent, and my parents were not previously
related. I do not handle snakes, nor am I a member of the klan. CB, FRS,
and the scanner are mere hobbies for me, in addition to my many other
hobbies. I do not have a "shack" that I sit in for hours at a time.
Radio is a means of communication, and i treat it as such.

I'm not saying we're all articulate, intelligent adults (obviously), but
please don't generalize us all into the same category.

Folding the shield over the cover is a neat but only temporary idea.

The galvonic action that takes place between dissimilar metals
will eventually cause a resistance between the copper shield
and the chrome or nickel adaptor. Using this coax outside in
the weather will accelerate this process.

It only take a minimal resistance to cause a problem on receive.
The voltage levels are so low that the slightest connector or
shield resistance can cause a reduction in signal level.

Use the solder holes that come with the connector to
alleviate this problem. That's what they are there for.

Well seeing how you are addressing everybody then i figured I could
throw my two cents in.

I have read many posts from many authors for a long time and your
posts Gunsmoke are without a doubt among the worst of this group.
You have zero technical knowledge. Zero analytical power. Zero
humorous (intentionally humorous) abilities. And zero ability to see
oneself in the eyes of others. If you don't believe me then look at
your own post.

"The people on here are a bunch of real winners. I have never seen a
group of dumber people in my life" "You people fall for anything out
here and know nothing."

harmonics always make it look like alot of watts i can make an amp see big watts but the peak watts are not there
it is called severe overdrive drive a 2 pill with a 2pill and you will see big rms watts and
no peak watts

First off it is Mr.Bigshot to you. Secondly Any asshole with half a brain,which leaves you out doesnt mount a mobile cb antenna horizontaly let alone co
phased antennas. If your goal is to put 1/2 your signal into your vehicle and to not be able to talk more than a few miles then by all means mount your mobile antenna horizontaly.The fact remains you are a turd burglar........Explain your assinine reason for mounting them horizontaly...

Next time I charge you for the lesson nothing is for free and me schooling you isnt either......

Have a ex.cond. Tram D201 23ch. CB. This radio is STOCK....no mods...no extra holes....stock. An easy 9.5 on a 1-10 scale.I have seen D201's on ebay that did'nt come close to this go for more. If you are a Tram collector or vintage CB collector this one is for you. Comes with the stock D104 mic that also looks new. Price is $450.00 plus boxing and shipping from 96003 (Calif.). I can be reached at (530)241-0843.

Take care,
Stan

For me performance and reliability must be top-notch, and rare are those that have spanked as well and as long as the Davemades...

However, I have had Texas Star stuff (new & old) that did as well as the DM's... Recently tinkered with a great Messenger piece that also would compare to a DM... Contrary to popular myth, this stuff is loud & solid when done properly...

But nothing I've used has flatout beat the 6-pill Pacman I've had for years... When its hit with a Texas Star 2 pill it hasn't been spanked yet...

A friend has one of these side band radios. The original 5 pin mic socket is pretty well destroyed. He says it worked fine when the socket went away. I tried to replace with a standard 4 pin socket and mic (he has lost the origianl one). The radio does not appear to come up on frequency... unsquelched there is noise, but cannot receive. Also no power out on transmit. My question is: is there any weird wiring to thte original mic that could cause this?? Any help welcome. Also looking for a service manual for this radio.

Please contact my directly via email as I dso not normally check the news lists.

I got some old cbs from my grandpa and I was wondering if they are any good. I have a SBE Catalina
III mobile and some SBE Trinidad Bases. I also have a Motorola base but I am not sure what model so are the SBEs worth fixing and how do I find out some info on the Motorola, I have a catalog number for the Motorola. I would also like some general info on the SBE radios

Boswell.....

From: hifinut@my-deja.com
Message-ID: <8fi66c$601$1@nnrp1.deja.com>
Source record: 35432

I ordered two Cobra MicroTalk3 FRS radios from Bill's 2-Way on Wednesday 5/10/2000 along with two sets of "Cobra NiMh Battery Charger specials" and I ordered 4 Cobra FRS cases. I got them in 2 days! today, Friday 5/12/2000!!! CA to NY in two days and his deal included FREE shipping! Only one mess up, was that they forgot to include one set of the "NiMH Batteries and Charger special". I called them up and the saleslady who took my order said she would ship the missing order out to me at no charge for shipping! No hassle, no 3rd degree, she acknowleged their error. So I expect to get it next week now, but other than that I would rate these folks as a First Class act and an excellent mail order source to do business with. So far they get a big thumbs up from me and their prices were about the lowest around on the Cobra FRS's. On top of that Cobra is giving $20 Rebates now on the FRS radios. So I think Bill's 2-Way saved me a few bucks over other vendors in this package deal. Don't hesitate to deal with them. They provided me excellent and outstanding service that impressed me. FAST safe packing too.

i have run
dave, noname, x-force, and gooserider.
gooseriders are more money but well worth the extra $$ for the extra watts.
all the rest are putting out the same numbers.
i guesss if i was'nt running the gooserider i would run the dave..
just my 2 cents.

Source record: 35443

A body shop will charge about the same amount to repair a 3/4" hole as they would metal deep scratches, drill it and mount the Wilson 1000 or 5000 and all you have to do is to remove it unscrew the antenna and put the plastic cap in its place, it is very quick and east to remove and it is designed to do this. You will have better performance longer life and an easier removal, not to mention you will not have coax going thru your window. If you do go with a magnet mount go with the Wilson 1000 or 5000.
--
-=PEAKABOO=-
>>>>>>>>>>><<<<<<<<<<<<<

Thank you! I did it on my 98 Tahoe, and I just did it again on my Yukon 2K... Everybody said I was a bad man for drilling my new Yukon, but I said that was the neatest solution that talked the best and looked the best. I have dual air and heat. I removed the back ceiling light near the back door in the center of the back roof area, and drilled it right there. I didn't even have to remove or drop the headliner. It talks! I then replaced the ceiling overhead light and no one knows the better. It's neat, it's grounded, and my Gold Yukon looks sharp as you have to look twice to see the antenna. Boo is correct about removing the antenna and putting the plastic cap on it when you are finished, as no one see's it, even if you trade it. The dealer that took my Tahoe never saw it. The Wilson 5000 also has the heavier coax(rg8x) instead of the rg59 that the cheaper 1000 roof mount comes with. SWR is like 1.2..... It takes up to 3000 peak watts ok. Doesn't get warm enough to worry about.
Don't worry, just drill it! It won't talk until you do!

1671. Re: Measuring power with meter

Newsgroup: rec.radio.cb
Date: 2000-05-13 00:00:00 UTC

Source record: 35444

It's not even that, as much as most of these high readings are from 20 volts or more! no way a two pill keys 1000 with out a lot of key in to it as well as it is volted to the hilt!
51 in the Carolina's
<<<<<<<<<<<<<>>>>>>>>>>>>>>>>>
Doc wrote
Redwire,
A lot of the confusion with power readings is that people really don't know what kind of meter they are using. Does it measure RMS, Peak, or Pep? Thats where part of the confusion arises.
You can measure power with any of these different kinds of meters. If you know how to convert from one type to another, you can express your reading in RMS, Peak, or Pep. But you do need to know what kind of meter you have. If you measure using a peak-reading meter, then convert to Pep using the 'RMS to Pep' conversion formula, the resulting power 'reading' is very impressive! It's not correct, but it is sure impressive.
If a watt meter has to have a voltage connetion for some thing other than dial lights, it's probably a 'peak reading' meter, and it usually has an RMS or 'average' reading position. If a meter doesn't need some kind of a power connection, it's an 'average' reading meter or RMS (probably the most common). The Byrd line of meters are all average reading meters, except for one model that uses a battery. That one is a 'peak' reading meter.
'Doc

Not for nothin' but all you guys are arguing about these amps all the time and which one is better or which could key on which. Wasn't it already stated that the box plays somewhat of a role, but it is the antenna system that will tell the tale. Anyone disagree??

937 chicago.....

It's the volts(charging system, battery storage, the grounds, return to battery) as well as the matching, the radio's audio and the antenna... the entire system.....that wins.

Source record: 35446

harmonics always make it look like alot of watts i can make an amp see big watts but the peak watts are not there
it is called severe overdrive drive a 2 pill with a 2pill and you will see big rms watts and
no peak watts

That's right! You can also make a bird read too many watts by mistuning the 54 mhz trap in the radio incorrectly! I was monitoring a higher frequency the other day, and I heard bleedover(mobile Z box) from ten miles away, and a guy was leaking all the way from channel 26 to channel 52 AM. I found him and told him to take the radio to a certain tech and have him check the output of the frequency for him. After aligning and setting the tvi filter, he quit bleeding so bad, the radio talked further, and his output was more realistic. His signal was now all on frequency.

>You radio puts out 45 peak watts? Do you think that is alot?
>if you had a 3 pill without the bias you would see more than 450 dosy closer
>to 700

45 watts is enough to drive my 2 pill . i have tried to drive it harder . i have a small 2 pill , i drove it at about 50% with 100 watts and saw a increase in watts to about 550-600, and a drop in sound quality and a BIG raise in heat . so i decided to stick with the radio driving it .

and as for doing a 3 pill without the bias ... heck no too many benifits of biasing , sounds so much better on AM .. and even more so on SSB . it seems to let the amp not work as hard to get good results .

Yep, still is. But then he did say the 'best' for SSB. May
not have any 'pills', but it also doesn't have the harmonics,
parasitics, and assorted other trash...

Doc, of course, they were in the exact location. I was inspired to make the comparison of several antennae due to the constant insistance that the 102" whip outperforms all, and that a coil would never outperform a whip.
No, I don't have expensive field strength meters, heat sensors, etc, but I did my best to make the comparison fair and equal conditions. They were tested for both tx signal and rx signal, with 4 rx'ing stations in 4 different areas. Of over 10 antennae I tested, 1. (first place) and 2. were basically tied between a 107" x 3/4" copper pipe and a home made aluminum coil antenna. 3. and 4. were very close between a Wilson 5000 and Valor's "Big Bubba". 5. was a 7' top load, and 6. was the 102 steel whip.
Wm.

>I TALK TO BOWEVIL OVER IN AUGUSTA,GA BETTER KNOWN AS ARMADILLO.HE SAYS
>THAT STEVE BETTER KNOWN AS PIRATE BOXES NEVER WIN ON THE KEY DOWN CIRCUIT
Well for that matter a lot of boxes don't win on the keydown circuit, but only a small amount of people key and they all seem to use the more popular boxes, the rest of us talk DX or just like to mess with the local mud ducks, and most of any of them work for well for doing that!
>HE ALSO SAID THAT GOOSERIDER AND X-FORCE IS THE SAME AMP AS A DAVEMADE
X-FORCE is a copy of Dave, just ask 123 he'll tell you.I have never seen a Gooserider so I don't know. (hey but that shouldn't stop me from anything, it hasn't stopped anyone else)

>HE SAD THAT BULLDOG AMPS THAT ARE MADE BY SLEDGEHAMMER AND
>MOWATTS AMPS ARE JUST LIKE A PALOMAR
Bulldog amps were sold by Sledgehammer, but Sledge makes Mowatt now! and are nothing like a Palomar, more like a X-Force, 123 tunes them.
A 12 pill can easly do 4500 peak. My Dave 8 will do 3500 on the peak side.
I agree! and in my opinion Dave does make the best box, you get what you pay for, and your list of who's, who's all make good boxes and some better then others, but winning is more then just the box! I see you never listed NO Name! Why? you seem to have an opinion on all the rest, what about them? And why would ARMADILLO be using a Dave driver? I think you need a new sorce of imformation.

Hi CD,

>geez, phil i think they must see a meal ticket, or something,
>$2000.00 , you have got to be kidding?,.....cd is out.....
Since my last post I received a message on my answering machine from J & N Auto Electric in OH confirming the prices.

These prices are actually a discount off the jobber price!

Retail for both the Leece 350 and the Niehoff 400 are in excess of 4K so 2K for new units seems OK!

They were unable to comeback with a price of the Electrodyne. I will chase them up on that one on Monday as I believe this is the only 'dual-stator' unit out of the bunch, though the Niehoff is a real monster of an alternator.

By the way, I don't think they see a meal ticket, as these units are brand spanking new, not re-builds or hybrid's, with hyped up numbers!

If you can pass me full contact details of anyone less expensive in the US for sealed and boxed 'new' units I would be most happy to hear from you.

My experience over the years has taught me that in the main life is made up of 90% BS, 5% rumour and 5% old wives tales and even then they stick a zero (0) on top of the ratings.

For example the president of Electrodyne told me in a recent e-mail that the max out of his E-350 is at 5000 rpm and it measures 385A. Now I've yet to be shown Toll's full-field 450+ out of one of these rascals.

Until that day arrives...

See ya

Phil / UK

Simple!
Turn the power off,
Pull out the old one, and line up the keyway spline (on the bottom of the new tube's pin locator) with the slot in the tube socket, and press gently straight down.

RollingRadios,
Other than the diameter of the radiator, and the extra
5" length, what would be the difference between #1 and the
102" whip? Normally, the 102" whip is/was used with a
spring making the overall length about 107-108", which is
a 1/4 wave on 11 meters. Seems the two should have given
you the same results. Only benefit of the larger diameter
of #1 is in bandwidth.

SUMMER Tech Class -Lindenhurst

Great South Bay Amateur Radio Club Amateur Radio Classes

Summer Technician class -Saturdays 9-11:30 AM

The Great South Bay ARC has scheduled Tech classes beginning
on Saturday July 8, 2000 at 9:00 - 11:30 AM and will continue
every Saturday until August 12.

All students are required to have the new version study manual
Now You're Talking! All You Need For Your First Amateur Radio License
4th edition c 2000 which will be available in May 2000 from the ARRL,
225 Main St., Newington CT 06111 and your local Radio Shack.

ADDITIONAL INFORMATION

All classes are located in the basement of Babylon Town Hall,
200 E. Sunrise HWY, Lindenhurst NY in the Emergency Operations Center
(ARES/RACES Room), access is gained via the door at the bottom of the
stairs at the rear of Town Hall.

If you are interested in attending a class or you know someone who is,
have them contact Phil Lewis N2MUN (631)226-0698 for further information
or just come on down to class. The class instructor is Walter KA2RGI.

Information is also available during the GSBARC 2 meter info net every
Monday evening at 7:00 pm on the W2GSB repeater, 146.685 -600 4Z(136.5)
PL required. You may also write to:

The thing no one has mentioned is that you need an input tone to measure power on SSB, saying audioooo into the mike just doesn't do it. There are a lot of surplus audio generators to be had cheap. I just got an HP for $25.00. It is also pretty easy to buid your own oscillator. I think most of the amateur radio books have plans for them.

A modulation meter is only useful on AM. It measures the modulation
percentage as it relates to the carrier.
The modulation percentage on SSB is 100% all the time because it can
not be referenced to a carrier. This meter has no use on SSB so the
people at Uniden may have made it inoperative on SSB. I don't know if
they did this or not but it really doesn't matter anyways because it
will only function as a relative output meter on SSB anyways.

It seems it would be that way Doc, but it wasn't. I know that pops the bubble of the 102 fans, but I'm sorry, that's the results. I'd love to run a $15 whip, but not if something else works better. That's why I did the test.

Man all i can say is you are always out here asking about boxes and which is good. Why dont you get off your ass and go talk on the radio or something. Also, if you really dont like things about these amps then build your own fuckin amp. Why is it so difficult to make up your own mind?? You ask everyone elses opinion on amps. Cant you decide on your own??

Yep. Don't worry, there's nothing wrong with your Washington, and
congratulations on buying it, it's a really nice radio. Great "ears" and nice
audio.
Only thing I ever found mildly annoying about it's receive is the ANL/NB button
which, when engaged, causes stronger local signals to 'bleed' much more
annoyingly in the speaker. I usually don't engage it for this reason, and have
no other problems... that front-firing speaker is very pretty-sounding!

Thanks guys for your reply... I got this radio for $100 and it is in PERFECT condition!!!! No mods added (as of yet) and very very few marks on it. This is going to be for my Son-in-law. I use a FT 101E for base station.. ..bought it brand new 20 some yrs ago!!! Also I have a three week old RCI 2950EX HD in the moblie...Now all I need is info to mod this Washington (upper and lower freq's) so that he can "come see" me some times...Not that I would ever freeband or anything..heaven forbid that is not legal!!!!!!

Thanks again!!!!

>Linus

About the NB/ANL problem..........This is common to all CB radios.
When engaging the noise blanker an extra amplifier is engaged in
the receiver. This is just a unity amplifier but it still has some
non-linearity to it. Because of this non-linearity you can expect
at least 6db less in selectivity. In other words when the NB circuit
is on, bleed over will be more evident.

Mistakes are often made by some technicians in using the NB/ANL
switch for extra channel selection. When this is done the tech ties
the NB/ANL on permanently. This is WRONG!!!! You should undo
this method if you have a radio set up like this.

Mav,

What Doc is telling you is correct. As far as I know, and according to all electronic theory I have been exposed to, such an antenna is impossible. For each parameter you mention, something else has to be given up to achieve. High "Q" antennas are narrow-banded, which is contrary to CB antenna doctrine. But it is a fact. If an antenna covers a large bandwidth, it is "sloppy" and efficiency is very low. From what I hear, the Wilson antennas are VERY good. I'd stick with it. Lots of mfr's claims are less than forthright/honest; they make big claims about their products since a good number of CBers aren't technically inclined, and they know most people have no way to test their claims. Here is one last "rule" about antennas. If you want performance, get a BIG, UGLY antenna! LOL! My wife always hated my mobile antennas on the car and asked me why they were so UGLY. When I told her I needed the performance, she shook her head and muttered, "I might have known!".

On a whim I purchased a really cheap Radio Shack handheld CB with the short flexible antenna for a recent trip from San Luis Obispo to Los Angeles. I managed to have a two way conversation while parked at the port of San Luis, so I know that the CB works. My problem is that I did not hear anyone talking on any channel as I drove to LA, even when I walked away from my car. I can sometimes hear some transmitters that seem to be far away and high powered, but I was expecting to hear and talk to other users of cheap 5W radios. Is this normal? I don't want to upgrade if it won't get me what I want, which is the ability to communicate with truckers and car drivers that are close to me on the freeway.

Hello Bill: You better go over your math and theory on this again.
Those Cable TV books don't always have it right. But the spelling is
correct.
I have corrected you as required:

Bill Nelson wrote:
>

>
> I doubt it. If that were the case, then all the tweeters in automobiles
> would burn out when someone drove past an FM station

You don't understand what Hamm4fun was saying or how his transmitting
signal was working. No the tweeters would not burn out, there not
transmitting a 10KHz tone.

- which has a much
> higher power density at 1 mile than you would get with a 10 watt amp at
> 50 feet.

Your 50 feet vs the range equation is conveniently arranged to be
correct at 50 feet, but in the real world 10 feet would be better and
more accurate, so now you a couple of range octaves off. You are
probably wrong with the 50 feet figure in just insertion loss of near by
objects.

> Bill Nelson (billn@peak.org)

Jay in the Great Mojave Desert, Rockin & Rollin just down the road ah
ways from the fillin station.

What a big head.you have. Nobody is getting worked up over you.
You are just to un-important for that. Rather everyone finds it hard
to believe how you seem to enjoy making a fool out of yourself.

However I truly don't believe you actually like making a fool out
of yourself. I believe that you are just to stupid to realize what a
fool you are.

Can you see how important you are to me?

I did have the squelch wide open. I heard lots and lots of noise and no human voices as I drove the 101 From San Luis Obispo to Los Angeles. Looks like I know what to do - go back to Radio Shack and ask them why. I figured to check out the hobby cheap then get good gear later if I like what I hear (ideally, warnings about hidden highway patrol cruisers so I don't get startled, maybe advice on places to stop and eat).

BTW, I heard somewhere that CH 11 was the one to monitor for highway/trucker use, but someone else said to monitor CH 19. During my trip I kept checking all 40 channels every 15 to 30 minutes - if I have to do that I think I will need a scanner.\
Any advice about channels?

question is should the meter be between the amp ant the antenna or the radio and the amp.....

1773. HELP..Galaxy 44 with no audio

Newsgroup: rec.radio.cb
Date: 2000-05-13 00:00:00 UTC
From: Andrew Taylor <drewtay@bellsouth.net>
Message-ID: <pApT4.15381$Qz5.130230@news1.atl>
Source record: 35596

I have a Galaxy DX-44 that loses it's audio. At first I thought it was a bad mic and replaced it with an Astatic D104. It worked for a while and then it disappears again. Not being a radio tech or anything I opened it up to make sure that all wires were connected and such. Put it back together and it worked for about 2 days and then disappeared again.

With talkback turned on (when audio is working) it appears to fade in and out.

Any suggestions?

how do you suggest mounting it in a car and running it off a 12 vlt system???

.....
Well, you can run it off a one transistor driver, a Texas star modv,or a Texas Star Dx250 and then drive it off a 120 amp alternator easily. Keep the carrier low, 100 to 200 watts on AM and drive the rest. It will stay clean, loud, and together. Make sure you buy the fan kit. Ground it well. Install a remote from Sweet Sixteen to front of vehicle. 3 to 56 ft coax to radio to driver, 12 feet to Sweet Sixteen, Wilson 5000 antenna behind it all. Great system.
Next, Just talk on it. Everyone will want to know where your base station is. Tell them you left it at home....you are in the mobile.

Mobile 51,
I'm afraid you've lost me. What 20 volts are you talking
about? And where did a 'two pill keys 1000' come from? Are
we talking about the same things?
'Doc

.....
Doc if you had been reading all the previous posts, If I remember correctly,
Peekaboo said he had seen a two pill key 1000 watts. Someone else replied that
he couldn't get it to talk forward at 1000. He agreed that it wouldn't talk
1000 watts. That meant that he was keying something into it at high key, also
that the 2 pill doing the 1000 watt reading was keyed to the max as well as
being volted to the max, to get that high reading, and would not modulate
farther than 1000 reading on the meter. To me, this would be useless, because
talking backwards is wasting and undue stress on all components involved,
including the bankroll.

>and the amp.....

First off i was just wondering if you re-calibrated the meter after turning the amp on?? If not try that first...also if you are trying to check the swr on your antenna then the meter needs to be between the amp and the antenna.

>
> Whats the best 8 pill on the market for ssb use?
>

Any good straight 8 with Class B or AB bias.
That means NO driver transistors.

If you want more details, e-mail me.

For example, the Texas Star DX1600 is a very
clean and efficient 8 X 2SC2879 amp. It will
serve you very well on SSB as well as every
other mode of operation. Its only drawback is
that it (like every other 8 X 2SC2879 amp) draws
alot of DC current. That means it will overcook
most stock electrical systems. A better choice
(if 1000 watts or so will do the job for you) is
a straight 8-pill using SD1446s.

What was happening was a guy was laying down about 500 watts of jungle booggie from the local FM station and I and every one else in the dorm was tired of hearing it. So I transmitted him a signal that concentrated all the power in his amp into his tweeters. The scuttlebutt was that this fried his tweeters but it could have been his crossover. He being about 3 inches taller and 40lbs heavier than me I thought it best not to get too courious. It did all have the proper effect though. From then on he was a lot more mindful of the people around him and kind of kept his stereo down to a more normal level.

>
>
>
>
>
>

Thats exactly what you do with a loaded antenna. Roughly 90% of the signal is radiated by the first 10% of the antenna the rest of the antenna contributes little and is there mostly to make the antenna resonant.By replacing a big chunk of the antenna with a coil you can have a short antenna that radiates nearly as well as a full size one.

1813. Re: What should I expect from a cheap rig?

Newsgroup: rec.radio.cb

Message-ID: <391E61E4.54467651@freewwweb.com>
Source record: 35537

You got what you paid for.

Next time try a tuned-up Uniden 510 XL, 520 XL, or, preferably, a PC122
and a decent magnetic-mount antenna like a Wilson 1000.

The tune-up is what makes the difference. A "tune-up" is an illegal
performance enhancement. In the average shop a tune-up is a transmit-
only enhancement. In a better than average shop a tune-up is a
transmit and receive enhancement. A tuned-up AM-only radio and a
decent antenna will allow you to talk to all the truckers and car
drivers you want.

The big problem you had was with the antenna. The standard CB
antenna by which all others are compared is 18 FEET long--yes I
said FEET. A short, helically-wound flexible antenna is going
to have such low efficiency that you could pump 100 times legal
power into it and still experience low performance--especially
on receive.

In short, if you want to be one of the "boys" on CB, you need to
buy a radio that has potential, pay to have it tuned up, and use
a decent antenna. A relatively small illegal amplifier wouldn't
hurt either. For example, a properly installed Texas Star 350
would really hit the spot if you know what I mean.

you may have just picked a quiet day. we havn't had very many of
them lately but there have been a few....I mean a day when there
wasn't much skip. but the truckers use ch. 19 so you should have
heard something there. don't expect much from a hand-held
because a radio is only as good as what it can put into and get
out of the air....and them little ducky antenna's ain't much..

Source record: 35605

We have one (1) 72 transistor mobile linear amplifier for sale. This amp. was built one year ago, and was used very little.
Amp. is in top condition. it has (72) 2SC2879 transistors in it. Normal output is about 10,000 watts.
Runs on 12v DC @ 1,440 amps. drive pwr. =750 watts "Note this is a straight amp. with no built-in drivers".
The guy who traded it is going "AC".

Price $4,500.00

Thanks
Art.

Don't operate on Sunday morning. You can kill time by going to the
church instead! Hee hee!

Seriously though..... I wouldn't run the amplifier when church is in. If
you are still bleeding through, you may want to put your antenna up even
higher. You could install some filtering inside the church in the form
of ferrites on the leads to the speakers & microphones on the PA system.

It won't rust if you install it properly. Pickup trucks and vans are the best 'cuz you can easily fill the hole when you go to sell - or just stick on one of those chrome weather caps. You can get Motorola style mounts that only require a 3/8" hole. I use an adapter to go from that to a SO238 connector on the bottom of my Sirio HP3000. Works like a swiss watch.

Well I don't so I ain't gonna! :-)
Seriously, you're right, but I don't seem to notice it as much with some other radios I've used/still use. Perhaps it's that speaker being as nice as it is, it reproduces noise as brilliantly as it does signals...

See my other response. I forgot to mention that I used a magmount for a time on one of my cars and the paint underneath the magnet actually went -lighter- than the surrounding paint. Quite the opposite of what you'd expect. I'm guessing it was some kind of chemical reaction with the magmount and the car's paint. It was an older car so I wasn't too concerned, and I suspect that paints are a little better now than they were twenty years ago.

1838. More efficient antenna

Newsgroup: rec.radio.cb
Date: 2000-05-14 00:00:00 UTC
From: mickey <mickeyNOmiSPAM@mickeys.co.uk.invalid>
Message-ID: <2c3755f8.4423f8be@usw-ex0105-037.remarq.com>
Source record: 35611

We are all aware that for practicalities sake 5/8-wave antenna
are usually manufactured in 3 sections.
For instance the Solercon 99 three times six-foot sections and
the IMAX 2000 three times eight-foot sections.

Now lets assume that both antennas where available in one
complete length, in other words no joints, would the antennas
perform more efficiently?

Cheers Mickey

Source record: 35612

Richard, you can get an -L- shaped bracket that mounts on the inner edge of your trunk or hood. These usually have a 3/4" or 3/8" hole that will accept NMO, and other popular, mounts. You -will- need to drill three small holes in the car, but they will be out of site when the antenna is removed. There are also many trunk-lip mounts available that require no holes. These usually attach with set screws and work quite well, some even have an adjustable swivel that will compensate for sharply sloped hoods/trunks etc. Check out Maxrad and Larsen. I've had good luck with Maxrad antennas and they are priced quite reasonably. I will say that their CB antenna bites though.

From: MC 10kW Jesus <qsl27@hotmail.com>
Message-ID: <391ED5B9.12C2EED9@hotmail.com>
Source record: 35613

I do believe that a car is the safest place to be in a lightning storm. Given that the antenna is no more at earth-ground potential than the rest of the car, I can't see it attracting lightning. It is generally accepted that, when talking about towers, every 86ft in elevation will increase your risk of getting a direct hit by x2.

MC

Take it from a trucker.
19 is the trucker channel.... unless you're north of the Grapevine in CA, or on I-5 in Oregon or Washington State, then we're on 17. Don't ask why, it's a LONG story.

Hope that helps.

-CGP

1860. Re: More efficient antenna

Newsgroup: rec.radio.cb
Date: 2000-05-14 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <391EC391.E25DFA64@qnet.com>
Source record: 35633

Hello Mickey: I measured and compared a bunch of antennas here at, home on the antenna range, in the Great Mojave Desert. And at times used surplus aluminum tubing that was commercially anodized, that when connected into a antenna it did not not make electrical connection, and the antenna had a very high SWR.

The point is, all the anodized aluminum tubing is now patio furniture, not bitchen antenna parts.

The A99 / I-Max 2000 (screw together joints) joints are made out of pretty good materials, and I would think that a one piece antenna as compared to the existing antennas, would cost way more to measure any differences than worth the effort. The energy flows on the surface of the antenna, and if the antenna has a good and tight screw in connection, I'd say your good to go.

The most noted loss's are in the impedance matching device.

Jay in the Great Mojave Desert, just down the road ah ways from the fillin station.

Take the RS junk back to them & get your $$$ back. Then look for a small independanty CB shop and prepare to spend $100 for a Pro-510 Uniden CB & a 3' magnet mount & a cig. plug on the power wires. Then you will have the bare minumum that will work from car to car & not have JUNK ! make sure the antenna is American Made, also. CB shop for almost 21 years, basically.
Dave

Yes, the people on this newsgroup are the "winners" and YOU are the LOSER. Some the the best CB techs in the country are on this newsgroup. And why is the criteria for "knowing something" the thing that makes you "great," o proud one! I KNOW that this newsgroup is a lot better than some of the other ones out there, like the HAMBO newsgroup and other forums. You had better "Fear God, and keep HIS commandments, and try to learn some humility, if that is even possible, o' proud arrogant know it ALL !!!!! If people can't read or write, it isn't their fault--it is the fault of the NEA teachers union!!!! This newsgroup IS more expensive than CB equipment. How much do you have in your pooter? More than a good CB setup, I'm sure, geeky one!!!!!!!!! Rich--I hope the million commie mommy march today blows away your "gunsmoke." The seesters for the 2nd Amendment will surely blow you away!!!!!!! Dave!!!!!!!!!!!!!!!

1868. EXport Jackson F.S.

Newsgroup: rec.radio.cb
Date: 2000-05-14 00:00:00 UTC
From: MrEvo <MrEvo@mailexcite.com>
Message-ID: <391F025D.2053E86A@mailexcite.com>
Source record: 35641

I have a older Export Jackson for sale. It has a silver faceplate. It has been in my truck,and has usual wear for a radio it's age. I would rate it a 8 our of 10.
It has 5 bands, 26.065-28.315
fine/coarse clarifer
mic gain
rf gain
+10kc switch
roger beep
AM/FM/SSB
squelch
nb/anl
It is in great shape electrically,and also has a variable echo board installed. I bough the radio used and it was in there before I bought it. I have the mounting bracket and power cable,and a aftermarket power mic.
$185 shipped.

ive not seen a dave on spec analyzer but i hear them on the air and they dont sound cleaner. if your driving the texas stars hard like you guys do the daves then it wouldnt suprise me that it is showing dirty. they are clean amps with a reasonable drive level. they dont need to be over saturated like some people do by driving two pills with another 2 pill. ssb's arent trying to squeze every last watt out so the texas star is the better choice for them and will shine on ssb compared tot he class c boxes that are mass marketed

>Texas star amps on the spec analyzer are much dirtier than Dave and X-Force.

How do you come to this conclusion. Specifically what did you test at
what drive levels and what input voltage?

Tested with HP spec analyzer at a local University by electronics engineer professor, each was a 5 transistor model, each at 14.0v and each with 2wcarrier input and 30w pep input.
Dave and X-Force show just a bit on 2nd harmonic, Texas Star was all over 1st and 2nd harmonic and showing some in 3rd.

>>Texas star amps on the spec analyzer are much dirtier than Dave and X-Force.

Not everyone drives the piss out of their boxes Tim. As a matter of fact, most don't. Most probably just as you want to sound loud and clear and have their equipment last as long as possible. That's generally how I set them up unless otherwise requested. With similar low input levels, the Dave and X-Force will well outperform Texas Stars with ease and sound clear doing so. I have used what is called class C on SSB with no problem at all except in close proximity where power is not needed anyway. I also have used the class B with super efficient results and clarity. I know many have a hard on for the custom builders, but in fact some are making a high quality product, well exceeding that of "Texas Star".

2nd harmonics at 54mhz or 13.5mhz. I assume this is what the
spec analyzer was showing.These undesirable signals can
be suppressed. But how about the other undesirable portion
of the spectrum. Namely the intermodulation distortion created by
these amps This would be the frequencies immediately above and below
the true transmitting frequency. This is what is audible to the ear.
How do these amps compare in this area?

this is the same mentality that people use with speech proccesors, oh yeah it sounds crappy up close but it must sound good far away. if something sounds bad close it sounds bad far away too, theres no difference except in signal strenght. the dx doesnt change your sound. i've never heard a class c box that didnt sound crunchy and raspy on ssb. they will work but who wants to sound that way?

Jay was using anodized aluminum; I presume that you are not. Bare
aluminum on aluminum, assuming a similar alloy, will make a good contact
and work well without any resistance, but over time will oxidize. You
need to use a conductive grease such as Butter It's Not from Butternut
or something comparable from the ele trical section of the hardware
store.

Save your $$$ away from Wilson. Just stay away from Rat Shack & get a Francis & you'll be richer with MORE range!!!!
Dave!!!!!!

b_helton@my-deja.com wrote in message <8ffpra$i85$1@nnrp1.deja.com>...
I tinkered with it a bit more and it now registers 4 watts on all channels. And to answer the meter question, no. I bought a meter whose sole purpose would be to give a swr reading and help in tuning the antenna. I ran a extra ground lead from the cb and I am now getting an swr reading of 1.3:1 to 1.4:1 on channels 1, 19, and 40. The range is much better so I'm content. Once I have a larger budget I'll tack on a Wilson 1000 or 5000.

Guy,
You may be right. I think I'd find out if the radio
was working correctly before doing something else. Then,
if it's possible, you might try an external antenna. The
external antenna can't help but be better than the one on
the handy-talky.

Hmmm. 18 feet. I couldn't dive with that on the roof without
hitting bridges and wires, but just having one would sure tell
me how much of my problem in in the antenna!

I suppose I could mount a long (maybe not 18 foot though) antenna
low on my bumper, but don't antennas work better if they have a
ground plane such as a metal roof would provide?

Hello Jet Star: Yes the Penetrator 500 kicked ass! I don't like the fiberglass sticks due to interference they always seem to enhance. They throw to much energy down below the horizon into the neighbors, where as the ground plane antennas don't.

Between the two mentioned antennas, I'd go with the I-Max 2000 with a good four 1/4 wavelength ground radial kit, if they make one.

I can shoot some pictures of New Design 5/8 if you would like.

Jay in the Great Mojave Desert, just down the road ah ways from the fillin station.

You are asking the same question that most new SSBers ask.
The reason the question comes up is because SSB CB radios
have a built in design flaw that makes multiple SSB talking
impossible. Let me explain.

It is a must when using SSB to have the ability to make the receive
and transmitt frequency track together. This can only be done by
unlocking the clarifier. This is a standard modification that must be
done to CB radios. The stock CB only gives you the ability to
adjust the receivers frequency. The transmitt frequency can not be
moved.in a stock CB.
No matter what, especially if your using your radio in a mobile the
frequency will drift , so you WILL be moving your clarifier to
re-adjust as the radio warms up. If you want your transmitt to sound
just as good as your re-adjusted receiver , then you have to have tx
and rx tied together. If you don't you will continually be told that
you are off frequency. This is no fun as you probably already
know.
In addition , no two radios will ever be on the same exact
frequency especially if you consider temperature changes. This is
critical on SSB. If you had just two off frequency SSB radios trying
to communicate to each other the standard clarifier setup will do.
However throw a third off frequency radio in the mix and it now
becomes impossible for any one of these radios to tune in two radios
at the same time. This is not a remote scenario. It happens all the
time with stock radios. Therefore the easiest solution is to tie the
rx and tx together and then multiple SSB parties can all tune into the
same frequency.
The exact frequency is unimportant as long as everyone is on the same
frequency.

I know there will be some disagreement here but by far the easiest solution for easy multiple party SSB use is to do this mod.

Subject: [AMPS] Johnson Viking Invader 2000 on E-Bay

If you think the un-built Heathkit SB-220 that went for
$3100 last week on E-Bay was something, a new-in-box
Johnson Viking Invader 2000 went today for $4250!

Perhaps we should be buying Alpha's etal amps and storing
them away for E-Bay in 30 years!

1917. Re: Antenna evaluation

Newsgroup: rec.radio.cb
Date: 2000-05-14 00:00:00 UTC
From: Maveric <maveric169@hotmail.com>
Message-ID: <8fo412$8h4$1@slb3.atl.mindspring.net>
Source record: 35690

I really appreciate all of the input everyone has given me regarding this antenna.

Here is the URL to the site I saw this antenna. If you feel like checking it out, let me know what else you may come up with as far their antennas and such. I was told by a friend that they were a good company but after the information I have received from all of you, I am really beginning to question that. Well here it is

http://www.stormcomm.net/stormfl.htm

The antenna I was considering is the FD/7SR with ear kit. (top right).

Thank you all again for the insight, and I hope to hear about anything you can say or what you think of this company. I am just steer clear of them all together.

AWI is "antenna warning indicater"
If this light comes on during transmit it means the SWR is high.

No, it doesn't come with those lower channels. It is possible to modify it for some lower & upper channels, but not nearly as many as the 55. And the modification will be much more difficult on the 949.

I am sure this subject has been beat to death but here goes neverless... :)

I am looking to install a base antenna on my home and was looking for advice on what works and what does'nt. I had a Hy Gain Penetrator antenna years ago (over 20) and loved it. I know that Hy gain sold that division and it "aint" the same. How do those A99 or Imax (?) 2000 work..looks alot like the big stick of the old days to me...comments are more than welcome!

Thanks

HI

Not a Dumb question! I'm not sure what the AWI light is either and [i admitt it] I spend all my free time in the local radio shack playing with the radios.

What's the catalog number for the radio?

Search the online manuals at http://www.radioshack.com

Hope that helps

HI

React is still going strong and doing a great job! There are also many individual channel 09 monitors who are very dedicated to monitoring the channel.

There is also U.S.E.R.M [U.S Emergency Radio Monitors] which is fairly new [only a few years old] but has many members across the U.S and is still looking for more monitors.

Their website is:

http://www.userm.com.tj

(When you go to their site click "Information page" to go to their main site)

Thanks Doc....Tim and Jay for the response! Seems like you three always are more than willing to help. I was never really impressed with the Big Stick...Like the idea of a 5/8 true ground plane antenna. The antenna makes up 65% of the station in my book...in fact I took that Hy Gain Penetrator and mounted it about 18" (inches) off of the ground...installed 6 #14 bare copper wire 32' from center line of the antenna directly on the ground..talked 175 miles ground waves bare foot (barefoot using a Yaesu 101E radio and SSB..radio was not cranked up..with this test. prob 20-25 watts or so). The reason I did this was to prove to a kid that the antenna makes a difference...He was saying sure I could talk everywhere because I was pushing almost 2K with all of my amps onl..Amps help..but they sure do make you a one-way station if you cannot hear people trying to get back to ya!!!!

And Jay I would be more than happy to look at that 5/8 ground plane..and even buy it or make it and test here in the good 'ol flat lands of Kansas...(hilly in eastern Kansas where I am at but what the hay!!!) I have putzed with all sorts of radio stuff..but as I have said in the past that was 'purt near 23 yrs ago...lost alot of knowledge since then...rasing dang teenagers will do it everytime...

Thanks again fella's

Peace

Ron

There is alot better amps on the market that are cheaper I think you need to learn a little about amps and designs etc and then you can tell us what a good amp is and what a junk one is. I run into people like you they come dime a dozen these days thinking a certain amp is the best when its not and all the people here that do know something about amplifiers run into it also !

Why do that when I run the X Force myself and sell on the average 20 to 24 a week. Dang you go from one extreme to the other. The best way to find out what you ask is to spend the money and go into business. Also I hate to say it, but do you think that the builders that you just named really like there name and business put on the street. With you not having any respect for them, the ones that read this newsgroup now would probably tell you to take a flying leap of into the ocean. Think before engaging mouth and it saves face. It takes dedication in this business.

All the guy did was announce a class. Why is it necessary for you to jump all over him? I'm a CB'er and I'm actually interested in becoming a HAM. I also happen to live about 15 miles from where this class is being held and will probably attend myself. So actually is message has already proven useful to a reader here. There's more important things in life to be angry about, his message which may not be of any use to you, is not one of them.

Jason Boswell <mbos@nospamiastate.edu> wrote:
: I just purchased a galaxy 77 and am trying out the SSB
: communications.....love it! Made 3 contacts in 1/2 hour tonight. But
: anyway I am having trouble using the clarifier knob I am not sure what I am
: doing and one of the guys told me I was off freq and I was wondering if
: anyone had a webpage or a text file that went into depth for beginners in
: SSB communication.

The basic process is to tune the transmit frequency until it is matched
to everyone else - then use the receive clarifier to get the signals you
receive sounding right.

This assumes that the clarifier only adjusts the receive frequency.

Gary Danaher <gdanaher@home.com> wrote:
: Jay was using anodized aluminum; I presume that you are not. Bare
: aluminum on aluminum, assuming a similar alloy, will make a good contact
: and work well without any resistance, but over time will oxidize. You
: need to use a conductive grease such as Butter It's Not from Butternut
: or something comparable from the ele trical section of the hardware
: store.

There is no such thing as bare aluminum - unless you keep it in an
oxygen free atmosphere. As soon as the aluminum comes in contact with
the air, a thin coating of Al2O3 forms - basically instantaneously.

But neither anodizing or the natural oxide coating should be a problem.
Just use a good anti-corrosion paste meant for aluminum on all joints.
The screws that hold the sections together will provide plenty of
conductivity.

Source record: 35728

Don't slam the big sticks like that. They were alot better than the old blue crossbow RS antennas. Bigsticks were a center fed vertical 1/2 wave dipole. The RS were end fed and use a very crappy matching network that would burn up at 20 watts. They did have one saving grace. When you smoked one you could rip out the matching network and make the antenna a center fed dipole like the big stick.

1956. A99 mod.

Newsgroup: rec.radio.cb
Date: 2000-05-15 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <20000515005858.14587.00006216@ng-ch1.aol.com>
Source record: 35729

Those who have the A99 will note that they produce a lot of interference. This is because they produce RF currents on the coax shield. I added a simple choke type BALUN to mine and it cured the problem I sometimes had of RF messing up my computer. Choke was a store bought deal I bought from the Wireman, a bunch of ferrite cores on a length of RG58x.

>quad or yagi, and you won't be disappointed.

Wrong. The PDL II is a two element quad antenna.

They have about the same forward gain as a three element yagi - which is
normal for quad antennas. Those full wave loops provide gain over half
wave elements.

Yes 25 is considered short wave but I suspect you are hearing a link
transmitter to a station in FL that has been reported on rec.radio.shortwave
many times.

1963. Hey Hamburger Man (About your amp questions)

Newsgroup: rec.radio.cb
Date: 2000-05-15 00:00:00 UTC
From: Miles Davis <MDD327@aol.com>
Message-ID: <8fo8l3$ok5$1@nnrp02.primenet.com>
Source record: 35736

I just talked to you on Friday or Saturday and you made a good trip to the Westcoast. Why not stick with the brand of amp that you are using now? When you drop a lot of names and sling a lot of mud you are only hurting yourself. These guys that manufacture tend to respect each other more than you think. They are not hard-up for your $600-$700 when they have orders from repeat customer as well as new from all over the country. They will gladly let you be someone else's trouble if you continue to try to put them against each other. Much worst, You man have to buy a box from some guy on eBay and get no support at all from the builder. Bridges are made to be crossed not burned. These boxes can be configured to do anything from winning competitions to staying keyed all day. It all starts and ends with what you ask for. If you want to "Run things" on the Super Bowl then you need to get a box with some "Run Things" inside. They won't be pills. At this point you should buy a box and if you don't like it sell it and get another brand. Just hurry up and pick someone.

"Tune the transmitt frequency until it matches everyone else?" How do
you do this? Without a tied RX/TX what you are asking to do is like
asking a blind person to shoot a paint gun at a friend. He doesn't
know where to shoot it. Unless he listens to the friends voice. At
that point since his ears are tied to his hands (RX/TX), he can now
accurately point the gun.

arrr me harties, when ships were made of wood and men were made of steel, those were the days. Now we have to put up with bloody females at sea. How stupid - typical bloody politicians enforcing dangerous changes on the defence forces without consideration to the dangers they place people in as a result of their "touchy - feely" changes!!

AWI stands for 'Antenna Warning Indicator'...if on, it indicates a high SWR condition on transmit... just because it's off on transmit doesn't mean your SWR is perfect.... generally speaking it may only light at an SWR worse than 3:1

Hello..... I have a Galaxy DX-2527 Base Station Radio, I aquired from a friend. This radio has been peaked, tuned, and converted to 11 meter.. It has the Mr.Jiggs
Ping/Double Ping/Doorbell (Keyup Toy) installed, along with a Workman Road Runner (Double) Rogerbeep (Unkey Toy).....Both are switch-operated, and can be turned on or off quite easily. The radio also has an Astatic D104M6B handheld microphone. I have the stock mic, along with the original box. What is this thing worth?? (I'm thinking seriously about selling it) I don't use it much, and I sure could use the $$$$ for other things.

My E-Mail addy is: Maniac9188@aol.com

18 foot is for base antennas, the best one for a mobile is a quarter wave 9
foot antenna but a wilson1000 or comparable mag mount is more practical so your
not hitting everything when you drive

I don't recall there being an HB-20C. Could you be referring to
the HE-20C instead? I see them on eBay fairly often. Lafayette
sold a lot of CB gear back then. As I recall, the HE-20 line was
not exactly known for stellar performance.

That is one of the problems with SSB. Everybody hears an SSB signal differently. You can tune in an SSB signal to your liking and someone else can walk into the room and will retune it slightly because they like to hear the audio slightly higher or lower in frequency. Even after you get the other station tuned in as above, the other station may not like the sound of your audio to him, so now he retunes to better clarify you. If his RX and TX are tied together, then he now moves his TX freq and now you have to retune him and if your RX/TX are tied you move your TX freq and here you go, chasing each other all over the place. The best way is for everyone to get as close to each others transmit freq as possible with the RX/TX locked together, then use the clarifier on receive only to adjust for the best clarity to each liking.

Hello,

As the titel states I am looking for websites about RACAL RA17 receivers.
I have found a few in the search engines but perhaps there are some more to
be found not
mentioned there. (Is this a good sentence???)

Greetings,
Andr&#65533;

hey mod old buddy , i think you have a very generous meter and i think
you are definitely overdriving that 8 pill, no doubt about it. now i do
hear you in there from time to time, but that is only when the big
strappers aren't on the key. to my way of thinking you are a pip squeak
as far as channel 6 goes,.....cd is out.....

1993. Re: What should I expect from a cheap rig?

Newsgroup: rec.radio.cb
Date: 2000-05-15 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <gnTT4.40752$Xk2.146106@tor-nn1.netcom.ca>
Source record: 35766

Hello Guy,

I too have a handheld and it is practically useless in the car. This is true for my handheld scanner too. The metal car frame seems to "shield" the radio and attenuate all of the signals coming in (and going out). Handhelds are also very poor at eliminating noise from the engine, heater fan etc. Having said that, they are great fun when you are out and about on your feet !

If your handheld has a BNC antenna connector, you could buy a magnetic mount CB antenna and put it on the roof of your car, and then purchase an SO239 to BNC adapter to allow you to plug it in to the handheld radio (note to anybody reading this: please let me know if I have these part number correct so that I don't provide false information).

Up here in Canada, you can buy a cheap mag mount antenna (approx 36" in length) from Walmart for $30 (about $20US), but more money spent on a Wilson or K40 antenna I would imagine would benefit you more. If you just want to test out the radio, try a local "junk" store or "buy and sell", and try out a used antenna. You could also discuss the problem with the Radio Shack store where you bought the radio, and perhaps ask them to let you try one of their demo antennas in the parking lot outside the store before you decide to spend any more money.

I have also seen an adapter cable at Radio Shack that allows you to mount your BNC antenna on the outside of the car window, but I have no idea how good they are or if they are only for scanner use.

You may want to try a cheap mobile CB unit from Walmart or Radio Shack. Walmart up here sell Uniden radios which are not too bad. I would imagine that any mobile radio will perform better than your handheld in the car, due to the better inbuilt filtering (because they are designed to be used in cars). You can attach a cigarette lighter plug to the power cord and operate it that way. Just make sure you set the SWR first ! (See your Radio Shack store or local CB shop for details). Car units also put out more power than handhelds so you get better range. Verify if your radio has a hi-low power output switch (some models do to save battery power).

Finally, I believe the "standard" channel for highway use is 19.

I hope the above will be of some help.

Best regards,

Richard.

1994. Trunk Lip Mount Suggestions for a 98 Mercury Sable

Newsgroup: rec.radio.cb
Date: 2000-05-15 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <hnTT4.40753$Xk2.146106@tor-nn1.netcom.ca>
Source record: 35767

I am considering trunk lip mount for my 98 Mercury Sable (so that I can feed the coax through the trunk for neatness), and was wondering if anybody else has attached one to their car (and where did you mount it ?)

Do they scratch the paint more or less than a magmount ? I am considering a K40 or a Wilson, is one better or worse than the other ?

Thanks,

Richard.

In the original paper work of a "real" A 99, not the solar con garbage, they reccomended 9 wraps of Coax around the mounting mast about a foot below the antenna. This helped to reduce some of the RFI.

You are correct that 25.870 is coming from Fla. Tim. It is a remote broadcast from a studio in Tampa. I have confirmed this myself with the communication engineer at WFLA. They even send out confirmation cards if you really desire one. The remote signal ties in with their skypilots, roving newsmobiles, etc.

You have 2 knobs where the clarifier is located. The smaller knob closest to you is the fine tune clarifier for receive. The larger knob closest to the radio is the transmit clarifier. This will change and deviate your frequency transmission. Both knobs should be at or around the 12:00 position if they are aligned. It is always possible the other fellow you were talking with is off frequency also. Start with both clarifiers at 12:00 and move slowly from there. Frequency counters are available that plug in to the rear of the unit. I highly recommend one .

If you don't get power to the power switch, then how is power getting
"halfway through the radio", what ever that means. If you have voltage
on one side of the resistor and none on the other side it means one of
two things. It is either open, as that was probably the case before you
replaced it, or something on the other side is shorted and drawing the
voltage down, as that is probably the case now that you replace it, and
that is why it is getting hot. Something is shorted and drawing lots of
current through the resistor which is why the orginal resistor opened
up.

Agreed as long as it is understood that you are completely lost
as far as placing your transmitt in a certain spot unless you cheat
and use your ears/receiver as your guide first.

Frequency counters if accurate, and if aligned, still won't tell you
where the station that you are hearing in your receiver is located
at. He could be at 27.3748 or 27.3751 How do you know? You
don't unless you take the BLIND operation of the transmitt frequency
control away. This is done by tieing and aligning TX and RX together
on one control knob. Once done your own ears will accurately align
your transmitter to the station that you are receiving.

End of troublesome SSB operation.

If there was no problem running noise blankers all the time then the
manufacturers would of removed the switch to make more profit.

The noise blankers circuit will lower your selectivity figure and will
allow more bleedover noise in. Try this. The next time a strong off
frequency station is near by flip the NB on and off. You will find
that there will be less bleedover with it off.

Not in my experience. These Ugly Ass expensive antennas have some
advantages over the stainless steel whip. As long as the Ugly Ass
antenna is not to short, made of highly conductive material, and
uses a large open are coil/coils that are not base loaded then these
Ugly Ass expensive antennas can beat the higher resistivity of the
stainless steel whip.

Change the 9 foot stainless steel whip to a 9 foot copper pipe
and then you'll really have the ultimate antenna.

Well, I agree that they are very UGLY. Expensive too.
Sometimes I think that if I did it all over again, (choosing an
antenna), I would have to re-think what is important to me.
In other words there is more to an antenna than just gain.

Gain only = 9 copper pipe.....guying required

Gain and looks = Wilson 1000

Gain and cost = SS whip or 7' Firestik

Gain, shortness = Ugly Ass Antenna

I heard a self-proclaimed pirate interrupt a qso between hams on 40 meters the other night. When asked for his callsign he replied that he had none. He believed that a ham license would enable the feds to "kick his door in". My question is, how many other, uh, outlaws, have similar beliefs, and why they feel their doors are worth "kicking in" in the first place?

well sa, how do he keep dat big ole beam on his mobeel, well mr big,
they obviously go somewhere and set up, whenever skip starts rolling,
which has been a lot as of late. these mudducks haven't got enough
green stamps to get anything bigger than a 8 pill so they use these 8
pills along with some type of mobile beam setup . only it is usually on
a relatively short tower. and i guess it helps them get out, but to me
they are still a bunch of mudducks in the mudduck pond. and i wish
hollingsworth would take a hawaiian vacation some time and clean out
this cesspool of illegal radio operations. then the great one would not
have to listen to these mudducks jumping up and down hours on end,
trying to get somebody to talk to them. all of this, while the big boys
are playing , you hear these pipsqueaks out there jumping up and down.
oh well whatever floats your boat, cd is out..........

Rodney you should crank the driver(m200) wide open and control the deadkey
from your radio ..Set the deadkey with
everything (M200,8PILL) CUT ON for about 500 watts DEADKEY for skip talking
and let it swing
to whatever it will do With a 2500 watts slug you should hold 1kw rms at 15
volts.

Cool it.Talk like this could brand you as a individualist. The sheople
of this world would love to give away their freedom because they
blindly trust our government and believe no one other than our own
government knows what's best for us.The trouble is they also believe
they know what's best for everyone else.

Theres one in every crowd. A pirate who interrupts ham freqs. to me is as bad as the ham who spews his pro-law speeches to the freebanders. I have respect for many hams. Many friends of mine are hams. Me, I'd rather talk around the world on a few dollars less then what a ham puts into his station, am not interested in repeaters rebroadcasting my signal, I listen to many ham bands and I must say that I find the freeband much more active and the folks more interesting. I am curious as to why you would even expect some idiot who was interfering illegally on a ham band to actually give you a call sign.

First you have to know something about what your working
on. It sounds like 'Hippi Freak' doesn't have any idea what
he's working on. Then, trying to explain how to fix it on a
NG really puts the frosting on it.

2049. Re: Trunk Lip Mount Suggestions for a 98 Mercury Sable

Newsgroup: rec.radio.cb
Date: 2000-05-15 00:00:00 UTC
From: W5LZ <w5lz@oio.net>
Message-ID: <39207142.6868A8B0@oio.net>
Source record: 35822

Richard,
If a 'trunck lip' mount is make correctly, the only
metal to metal contact should be under the trunk lip,
out of sight. The contact do need to be tightened enough
so that you do get metal to metal contact.
Anything you set on a car body surface will eventually
mar the paint. Dust and dirt, etc, collects around the
mount, slip under the mount, and from normal car/mount
movement, cause scratches etc.

2050. Re: Night Stick vs. Firestik antennas?

Newsgroup: rec.radio.cb
Date: 2000-05-15 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <391b4c15.1862518@news.iserv.net>
Source record: 35823

Greetings!

There are design differences, it depends on if you want a lot of
loading all compressed into one area, or the gradual [logarithmic]

I personally prefer the Firestik due to response it has on my vehicle
in providing a low SWR for a wider range of channels than that of a
similar top-load nitestik.

Although with my engine noise and type of vehicle, the Firestik just
holds up better than the Nitestik.

Both are durable, yes, but the receive and transmit issues
vary with both.

And yes, I used a 5' Firestik and only a 4' Nitestik for
comparison - it's not a fair one but considering the nature
of the beast - the Firestik offered a simple Tunable Tip
that the Nitestik model I had, didn't - had a little tuning
but it was originally longer - a couple of snips of the turns
on the top load, we had equal results as far as SWR when the
vehicle was stationary.

For emphasis, I used a 4' Nitestik compared to a Quad-Wound
from Barjan - the Barjan gave better performance. Both were
equal in length - the only difference was the type of wind
used in the Quad, 4 wires instead of one.

But then, you had four times the surface to work from.
And the Quad-Wound was $14 bux cheaper and was purchased
locally. [No shipping]

It's a tough call, but when it comes to splitting hairs over all of
this, I'd run a Firestik anyday - It's earned my trust.

2051. Re: Antenna Problems.

Newsgroup: rec.radio.cb
Date: 2000-05-15 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <391b4ebf.2544282@news.iserv.net>
Source record: 35824

Greetings!

Sorry to hear the Midland didn't survive, these newer Midlands are not as well engineered as they were a few years ago.

Perhaps there is hope for it, if my memory serves correctly, these had "vertical" boards soldered into place. It may be a simple fix of reheating the solder joints that make the conection and hold the board in place. Any dealer worth their salts can take a look at it and see if it can be fixed with some simple resoldering.

On Thu, 11 May 2000 02:16:18 GMT, while the modem was pondering it's navel, b_helton@my-deja.com dissertated the following:

...[...]...

Hello All,

Visit my page for items for sale. Will be listing the items in the next 7-10 days on E-Bay. I'm building the list and will be adding photos in the next couple of days. You can view the page at: http://www.jones-clan.com/EBay/

Cleaning out the shack and do so spring cleaning. I will consider any serious bids - if I recieved none, will list it on E-Bay. Will use the funds to upgrade the shack and help out with out ATV Repeater with the school club.

Happy Viewing.

Well the way I hear it is this, and take it for what it is worth
because I really don't know.

When you accept a ham license you also agree that the feds can
come into your home and inspect the equipment without a special
warrent. Of course this seldom presents a problem for most
folks. But if you happen to run a cult or be involved in a "Ruby
Ridge" or "Wacco" type situation the feds can use the ham license
as a way through the door.

If there is a licensed ham station operating on the grounds the
feds will ask to "inspect" it (after all you accepted the license
and gave them the right to do this.) When you refuse they have no
problem getting a judge to issue a warrent at that point. No
resonable suspecion needed....just want to look at the station.
So the judge has no problem issuing the warrent.

It's just one of those "catch 22" situations that 99.99 percent
of all hams don't have to worry about. For the feds it's sort of
an Ace up the sleve when they need it. They love it when a para
military group or cult operate a legal ham station on the
grounds. All they have to do is get a few neighbors to complain
about interferrence and they can legally enter the grounds.

Then again I could be wrong. Maybe it is just an old wives tale.

2068. Question on Calculating SWR

Newsgroup: rec.radio.cb
Date: 2000-05-15 00:00:00 UTC
From: "Michael B. Tinsley" <mbtins_nospam@mindspring.com>
Message-ID: <8fq89q$1i1$1@nntp9.atl.mindspring.net>
Source record: 35841

When you take this measurement, does it matter if the antenna you are adjusting is actually mounted to the car that it will be on? Or can you set it while attached to any car and have the same SWR as you move the antenna from car to car?

Further, does it even have to be mounted to a car to set it? I.e. does the car body have any effect on SWR?

Thanks.

Mike T.

You certainly need to have the antenna mounted on the vehicle it's going to be used on before making the adjustment. Different vehicles will present a different mass of groundplane to the antenna system...

2073. Re: Trunk Lip Mount Suggestions for a 98 Mercury Sable

Newsgroup: rec.radio.cb
Date: 2000-05-15 00:00:00 UTC
From: CitySlicker <manno_d@hotmail.com>
Message-ID: <8fqa7s$dim@chronicle.concentric.net>
Source record: 35846

I have a Wilson 1000 trunk lip and it works well. It has a rubber boot to protect the car. Although dirt does build around it and under so was it regular. Make sure you scrape away a little paint where the set screws tighten to the under side of the trunk. You can put a little oil to protect the paint once you have the mount tightened.

2074. So what about a base station?

Newsgroup: rec.radio.cb
Date: 2000-05-15 00:00:00 UTC
From: Redwire <graydogsNOgrSPAM@yahoo.com.invalid>
Message-ID: <06fd900b.e305aeeb@usw-ex0103-086.remarq.com>
Source record: 35847

So what is a good export base station? I have read reviews that say the RCI "rack" mount models have problems (just 2950's in a big box....though I like my 2950).

I have a few rack mount radios....ok I lie...I have a lot of rack mount shortwaves. R390a, NRD's, Redifones, etc. If I wanted to add a CB base to my rack system what should I consider?

Hello to all,

This is a bit off-topic for the hams, but...
If you have any interest in vintage CB radio, please drop by
my Raytheon CB web site at this address:

http://www.qsl.net/k5dh/raytheon.html

It's a "work in progress", but there are specifications and
pictures for most of the Raytheon models I can identify. I
am looking for radios for my collection, along with any kind
of advertising, magazine articles, sales literature, manuals,
and so forth. I'm especially looking for scans of magazine
ads that I can post on the site. Please check it out! :)

what is your definition of competition, mod old buddy? if you indeed have a eight pill, then you are taking advantage of skip conditions and water augmented ground wave propagation. now taking that into consideration how can i or anyone else 6,000 miles away 'compete' as you say with you unless conditions beyond my control are in effect. now if you compete on a local level which in my opinion is where the action is, instead of this incessant ranting and raving on channel 6, then you have my undivided attention. and then sir , you sir, would be sent back to the back of the bus and/or the goody store, which is where you belong. because you need some better radio equipment and in order to get that , you need to get yourself a job and get a life, because boy, as far as i am concerned, you are a johnny come lately and it is patently obvious to me, somebody pumped you up and then spun you off. this is your probation officer, officer cd, and i am back

quiet...................

Exactly, and if I am not driving around drunk, what do I have to worry about? However I am sure the paranoid types will say I may be stopped by the cops any day now and they will use their "power" to search me and throw me in jail. Hasn't happened in over 40 years of driving yet. The only time I was ever pulled over and the only ticket I have ever been issued is when I was over the speed limit, that's my fault. Been a ham over 35 years and have yet to have the FCC or "Feds" bust down my door and confiscate any equipment. Could it be because I try to obey the laws? I find it is usually those who have something to hide that run around screaming about abuse of power.

That would make you the bottom feeder of the ng, since your meaningless, trivial opinion alludes to lack of wit here, one can only suppose that you hold no real level of intelligence and do what comes natural to the species that finds itself most lacking, and that is to lash out at those who you feel are responsible for your inferiority complex.

Not everyone hears SSB the same, some like the pitch higher, some like
it lower. Very seldom will two station tune "exactly on frequency". That
is why everyone will probably never be "exactly on frequency" and you
use the clarifier on receive only to tune the other stations as you like
to hear them, this leaves your transmit frequency alone so everyone else
dosn't chase you.

In a perfect world once you set your ant on the frequency you want it
resonent on it should not change from vehical to vehical,but it does not
always work that way,so you should recheck swr.
The car body is the ground plane,like ground radials on you base ant.So it
is a part of your ant system.

HAHAHA , you expect us to believe this is your amp.... this is no prototype amp , if it is how can you already have a etched board made. And the unit is already in a chassis ,which recieves a wrap around lid, go blow smoke up someone elses ass... To prove it is yours take a picture with your hand or a soldering iron included with the amp... Otherwise nice try.....

Lets get a few facts straight about your comments , the largest dealer on the net was pushing xforce amps not davemade, he ordered 2 amps total from davemade m200's i beleive , he has never had to deal with davemade concerning any type of customer service. In fact Dave had to wait for payment from your so called largest dealer on the net, so how could he bad mouth them. other than that I have several emails still on file from people saying how "he" pushed the xforce over davemade and that was from day 1 .. please get your facts correct before spouting of. While dave is developing these ideas in R&D they are strealing them and charging much more ......You figure it out

> search of your premiss. They would never do that.

The FCC has an entrance loophole even if you only operate a CB or FRS
radio!! But the FCC can only inspect radios, their authority is
limited
to radios (ONLY!) (emphasis mine). Regular police have no jurisdiction
over
radio normally (Exception-interference to public safety freqs).
However,
even a CB opens the "loophole" you so fear since you are given a LEGAL
CB LICENSE
BY RULE (see part 95) so if the police want to carry out a less than
honorable
search do you think anything will stop them? (The Police or the FCC
could carry in
a throw down CB hanheld for that matter), on the other hand, I have been
stopped
in Canada with my Ham Gear and my LEGAL AMATEUR license issued by the
FCC stopped
a search dead cold for a scanner/radar detector due to treaty
conditions, try that
with only a copy of Part 95.

If I may correct you ... concrete man declined to sell to Exports RUS since xports was playing davemade against Xforce with the consumers, davemade already had 2 websites and exports were selling davemades for more than the dave websites ... Kinda counter productive ...if you think about it .. Why would they need exports rus when they have there own internet sites.. ?? Since you guys are all rockets scientists..

Mpore the reason to have documentation, The Judge may only asschew but
the next time he sees that character in his chambers, integrity goes
to zilch for the rogue cop and he usually gets discredited down the
line. Judges in my experience don't like a rogue since it opens the
door for reversals and loss of integrity.

CD.....I was going to sell my X-force 16-pill but a friend talked me out of it. Secondly, My dave box was bought way before X-force came around. I also am not out here to promote X-force. I could really care less what the hell you buy. If davemade is what you like then thats great Its an awesome amp. Whenever did i state that i hated daves stuff?? If you ask me they are the same. Granted X-force is out here and it is more convenient they also have great customer service. As far as the guys who sell dave stuff here they act like their shit don't stink. Remember when that guy asked for a simple price and the response was along the lines of: "I can get it for you. The price is $$$. If you don't want to pay that price then sell your shit walkin"...Nice response huh???

2112. midland cb question

Newsgroup: rec.radio.cb
Date: 2000-05-16 00:00:00 UTC
From: Scott King <King.24@wright.edu>
Message-ID: <39218B93.2CCADB62@wright.edu>
Source record: 35879

I was given a Midland CB (model 77-104A) a while ago, and I just recently set it up in my car and used it. It works fine, except for one problem that I've had. I had it on for about 15 min or so, and then the sound faded out and the power meter (a series of LEDs) stopped lighting up. I tapped it a couple of times, and it came back. This happened two or three times, and then it just went dead for good, so I turned it off. A while later, after it had been turned off for maybe 1 and 1/2 hours, I tried it again and it worked, but the same thing eventually happened. Does anyone have any idea what might be causing this? Can anyone recommend a place that I took take it to in the Dayton, OH area to have them look at it? Or should I just forget about this radio and look at getting a new one? Thanks a lot!

Scott

2120. Mic connection for RS 446

Newsgroup: rec.radio.cb
Date: 2000-05-16 00:00:00 UTC
From: rgray@kc.rr.com
Message-ID: <1MgU4.21915$_I1.194038@typhoon.kc.rr.com>
Source record: 35887

Does anyone have the Standard PIN out for the 446 mic connection?
We are trying to install a noise toy on my son's radio and need to know which one in the audio.

Here is what we got off the internet and when it is hooked up this way his radio starts scanning the channels out of control

Pin4=Audio <------- the one we are suppose to hook up to but does not work
Pin1=Shield
Pin2=N/C
Pin5=receive
Pin3=Transmit

His mic has up/down buttons on it...there is no mention of that here. Can some CB guru help him out please!

Thanks

Ron

>
>
>
>

I have done the testing and gave the numbers, Where are yours? The DC resistance of a Copper antenna is in microohms, the DC resistance of SS is mearsured in Milliohms, BIG DEAL!!!! The differences in losses is unmeasurable except by the most sophisticated lab equipment. For REAL WORLD conditions both antennas could be considered "lossless" as far as IR losses are concerned. While SS does have much more loss than copper it will never have as much loss as that which results from shortening and loading the antenna. But thanks for the reply as it will give a chance to clarify my origional post. For the SS to make the 1db difference it has to have a resistance of at least 100 ohms probably even more. In the REAL WORLD an SS antenna has a resistance 1/1000th of this amount. What you said is that the resistance of the SS is so great that a shortened loaded antenna made of high conductance low loss material would outperform it. There is NO WAY is this going to happen but there will not be much difference either.

Check Concrete build this one he signed his name inside. This is a extra special box that Dave & Concrete Man put together & it does what they said it would do on my 12 volt system you see I only have one alternater in my toyota tercel that runs the hole car. I been running Dave Made since 1985 first box I got was the M-400 Muddy Waters turned me on to Dave back then but you can ask Dave about who put the first Dave Made in Honolulu. My opinion best amplifier ever made for mobile. I've been on the 27025 for 25 years now i'm not new to this game. Talk to the old timers cause i'm one of them. Aloha

I have run antenna tests before. I have posted the results here
before. The tests were made so that the only difference was a swap
of a quick disconnect. Multiple receivers (real world) jotted down the
results of the anonymous antennas. The SS whip never won, and
was beat by a couple different type of antennas.

Basically it was beat by a thicker or more conductive full length whip
or it was beat by a mildly loaded Ugly Ass type antenna that is also
more conductive than SS The results DO NOT lie. If you really
are interested in the truth ten you should run your own test.

>Martin

My whole point in this thread is to exclude as much involvement with
authorities whether local or national. There are rogue cops and others
that DO abuse their authority on almost a daily basis and because of
things like the "blue code of silence", and because of the "weak
versus the strong", and because the "one versus the many", and because
the courts are very lenient when it comes to a cop making
a "mistake in judgement" you don't have a chance.

So nip it in the bud and try not to allow big brother in your life any
more than is necessary.

Some people rely on printed material rather than REAL WORD results, and the 102 steel and fiberlass are several notches behind the "ugly" antennae and Wilsons. Jot this one down, Tnom and I agreed on something!

alright already, by the way bud i do have my shit straight, i mean give me credit for being able to read and write, which is more than i can say for most of the bozos on this bus, however, if my memory serves me correctly, you were trying to dump a 12 pill xforce on us several months ago, and having failed to do that, i guess you joined the band wagon and got yourself a davemade. well , welcome aboard. and as far as that crap about being treated less than right by the davemade crew. i would like you to explain just exactly what you mean. because as far as i am concerned, using common sense and a little logic, i would suppose you are a xforce plant , trying to help that bunch of chi town renegades sell amps to the detriment of the boys in jersey. now we all know how xforce was started. do we have to rehash all that bullshit? now as far as i am concerned, i think you are a punk for the xforce

crew and you have taken it on yourself to get out here and try to compare their rip off semi reproduction to the gold, no way jose. you boys got your ass handed to you , a few years ago at maywood and you are still crying. remember if it ain't gold , it ain't cold and dat is da real deal, no doubt about it,...cd is out.....

richard, we cbers aren't supposed to talk about stuff like that, we might infuriate our wonderful resident self proclaimed radio gods, aka, ham radio operators who deem it necessary to report our every move to the jack booted fcc thugs who peruse this ng from time to time. so for public consumption only i , curious dan, hereby will now tell you what a pill is. it is a small ball or semi flat shaped organic substance that should be taken orally for various health related matters such as headaches. now if you stay around here very long , you will get a headache from having to read some of these post that individuals such as rj compile, which are indicated to be in a shouting mode, which due to their very nature give me a cyber headache, which can only be cured by curse retorts and replys from the great one,......cd is out.....

Pinhead, do you have the Clinton administration selective memory? There has been several times that a Dave product has had it's hat handed to them as well. The largest radio dealer on the net will not sell Dave products due to lengthy order filling and poor customer service. X-Force has grown so much so fast because they fill orders and have excellent customer support. So with (as you say) X-Force being a direct copy of Dave = good product + excellent customer service and availability of product = better. As you said, use common sense.....business sense. Not all that glitters..........

Usually toys don't bring extra$ on a used sale. The radio used in EC with EC mike you specified would retail in a store about $450, street sale around $375, trade in around $300. Just depends how fast you want to move it.

> Hello..... I have a Galaxy DX-2527 Base Station Radio, I aquired from a

Source record: 35922

tnom@mucks.net wrote:
: On 15 May 2000 04:28:03 GMT, Bill Nelson <billn@spock.peak.org> wrote:

:>The basic process is to tune the transmit frequency until it is matched
:>to everyone else - then use the receive clarifier to get the signals you
:>receive sounding right.
:>
:>This assumes that the clarifier only adjusts the receive frequency.

: "Tune the transmitt frequency until it matches everyone else?" How do
: you do this? Without a tied RX/TX what you are asking to do is like
: asking a blind person to shoot a paint gun at a friend. He doesn't
: know where to shoot it. Unless he listens to the friends voice. At
: that point since his ears are tied to his hands (RX/TX), he can now
: accurately point the gun.

It is rather easy. All it requires is ONE station that knows how to
tune a SSB radio on receive properly. That one station then tells all
the rest whether they are on or off frequency.

All the rest of the stations, once they are on frequency, use the receive
clarifier to make the other stations sound the way they want. They will
not have to adjust for each station either.

On SSB, it is unlikely that everyone will be perfectly tuned - but they
will be close enough that the slight change in pitch will not be a problem.

It works well locally, I don't know why it wouldn't work elsewhere in the
world - unless only the local people here have good enough ears to tune
their receivers properly.

For the 20 or so people I talk to regularly, I have not had to touch the
clarifier for over a year. I just tune them in properly, then transmit.
They do the same thing if joining a conversation.

and what may i ask is your motivation for coming the defense of the
xforce crew? , it has been rumored that quality control has suffered as
of late in the chi town factory of dave made copies, is this not
correct? as far as the nonexistent customer support by davemade, has
it ever entered the fertile recesses of your mind son, that the reason
for that is that davemade products never break, is that a copy, so why
is there a need for customer service. anyone can call up the east coast
davemade headquarters and have your amp within a week, so why the heck
are you talking all this stuff about delays. you guys are so worried
about customer service because your amps stay in the shop, can't take
the volting , no doubt about it, ...cd is out.....

It is no different if you do not have a license. If they want into your house and have "probable cause" they can get into your house one way or another. By the time the FBI wants to get into your house they will have enough cause to get a warrant issued and to think any sort of radio license would make a difference one way or another is pure nonsense.

What a crock. If the DC resistance of a SS antenna was one ohm at worst you would have a 2% loss of power due to ohmic losses with a 50 ohm antenna system. For reference purpose a 1 db loss is about 20%. The actual resistance of a SS whip is a lot less than 1ohm. Also the impedance of the antenna is only 50 ohms right at the feed point. It climbs expotentially along its length until it reaches an impedance of several thousand ohms at the far end. This means that even if a SS antenna had an ohmic resistance of 100 ohms along its total length the loses would be inconsequential. This does not mean that I consider a full length 1/4 wave antenna to always be the best antenna to go on a mobile. The fact is that the field strength differences between a full lenght antenna and 5ft top loadedor center loaded antenna are barely measurable.

Redwire,
"They" are not going to go to the trouble of getting
a federal warrent to see your ham radio station. As they
have done in the past, they simply revoke your license, and
if the situation warrents it, issue a 'fine' (NAL). Don't
make it sound like an excuse to 'invade' your 'domaine'.

It's an old wive's tale.... hit this website and KNOW what the FCC can and can't do legally... station inspection-wise. http://www.fcc.gov/eb/inspect.html Having a license only means you risk the license as well.

Asschewing? When has an asschewing stopped a rogue cop
or other official from trying to pull a fast one? Cops and other
officials in the position of power abuse this power ALL THE
TIME.

Give me a break. One station give the approval of when the other
stations are on frequency? It must go something like this:

Hows it sound now?..... Your a little high..... O.K. hows
that? .....A little bit more..... O.K. that should be
it..... Nope you went to far..... O.K. how about
this?.....Perfect.

I'm sorry the above method is asinine. Use your own tied Tx/Rx to
accomplish the same without any intervention from anyone.

The classes of amplifiers all have to do with the amount of time the signal has the device(transistor or tube) turned "on". Class C is defined as having a conduction angle of anything less than 180 degrees. This means that in class C the device is conducting for less than half the time. Device biasing is the way this is accomplished. By changing the bias... you can regulate the conduction angle. This is most helpful and depending on the application of the amplifier... you can improve efficiency drastically by cutting the conduction angle. Get yourself a AARL book or equivalent and read more about amplifier classes and biasing schemes.

Don't go around do a bunch of stupid stuff. I don't drink and drive
(don't even drink), I am aware of speed limits and manage to drive at
the limit 99% of the time (the one time in my life I did and got caught
the office was very cordial, almost apologetic for issuing the ticket).
I don't go around looking for trouble, I stay out of places where
trouble can easily be found, I don't knowingly do anything illegal, I
try to obey the laws. Ever think about keeping your nose clean, do what
is right, and maybe you won't have to worry so much and be so paranoid.
Of course you think anyone who does that is just a sheep rather than
someone with common sense, so that probably dosen't fit you MO.

Hardly... A class C amp can faithfully reproduce the input signal by having a high "Q" tuned tank in the output. It's done all the time! That is the true meaning of linear.

Yes, most likely. And there is nothing wrong with class C amps! They are excellent for AM and FM. However... their use on SSB is not recommended because of the lack of carrier.

CD,
Thanks for your considerate reply! I was just curious, that's all. But then I am partial to Chevrolets anyway. It seems that over the years, they produce less ignition noise, as you said, have more room for radios and such, as well as being more reliable. I have an old Celebrity station wagon I have had since '87 that is ideal for radioin'. Lots of room for radio gear and places to put stuff in the back. I am lookin' at an original 1940 Mercury, believe it or not, at a local used car lot. Hmm, I wonder how I can run my 12 volt equipment on that 6 volt system? LOL!

Thanks again!

Jerry

Since you specified SSB... you would wisely choose the AB amp. This offers the best efficiency for the mode you need to run.

The class of the amp has nothing to do with reliability.

P.S. There are no class A amps out there from the major players. These amps combined with the transformer matching arrangments they utilize would have very poor efficiencies... perhaps around 25%!

Well, class C runs 50% or less of the time. You are kind of right about the filter... as you put it... really what you are describing is the output tank circuit which cleans up the distortion which is caused from a low conduction angle.

> >Class C runs about 50% of the time [like a rapid digital switch] and

Flexible???? the proper power source is a prerequisite of any amplifier... The class of amp operation has nothing to do with fidelity of the audio signal... except for SSB in class C. This combination will have some audio distortion as a result of the device being turned on by the audio and not a carrier.

> Class C amps are the most flexible of amps, as they will operate thru a
> variety of volt/amperage power supply conditions. However thier fidelity

The answer here hinges on the fact that class C amps use the carrier signal
to bias the device on...

> Tell me, since a class c amp, by definition, is bias beyond cutoff and
> only conducts over less that 50% of the input cycle, how do you feed it
> with a modulated signal, such as the output from a transmitter, and get
> a good clean signal out of the amp? Where happens to the portion of the

I have been ruining a Midland 75-822 handheld in my car w/ the 'mobile adapter'; using a Hustler HQ-27 antenna & magnet mount. My estimates are about 2-4 miles range. It's VERY noisy, most of the electrical systems cause noise using the cig. lighter for a power source. As others have stated: a lower cost mobile (most likely a Uniden) would work far better than a handheld. Good luck, Omar.

I hate to be so blunt but you are full of it. A S-meter that
registers a change does so because there is a change.
Period.

How much more proof can you possibly need. After all
you are skipping all the bullshit about field strength and Lab
equipment and theory and going straight for the final indicator.
The S meter. It doesn't lie. It is the best relative indicator of an A
versus B test.

> I've done the test between a SS whip and a 3/4inch copper 1/4 wl

>former and not the latter as I do not believe you are an intentional BSer..

You obviously can not get enough resolution to measure a change. I can
and have. To confirm this I ran the test multiple times. Guess what?
The S meters used, that's plural, perceived the same results after
repeating the test many times.

So you better go back to the drawing board if you can't perceive a
difference. I have always said that this difference is minimal, but
discernible and because of this should be reported as being such.

I don't know the professor but I do know of him...have discussed
him on the phone to people that do know him.. and i now
understand him better. didn't like him very much at first....
doubt if that bothered him very much..ha ha but I think he is
a very smart and capable person and there is no doubt in my mind
that its his amp....

think I'm gonna cry!

dave

Matched as far as lot #, but not as far as gain, these types of amplifiers
have the base of the transistor grounded so it is not that critical to match
the transistors.

No push pull match from me, duck. Its just too bad you won't
post your real email address and handle on this NG. Gotta hide
behind your child molesting "ICE CREAM MAN" name and not the
real deal. You're just a little duck in the sea of BIG RADIOS
and you come here to pout because you can't key on the bowl.
Whatever floats your duckin' canoe, boy! From the likes of it,
you are very knowledgable in this radio hobby but you can never
key. WHY? Because you're a CBer turned HAM. You went the
other way because you got picked on as a CBer and this is your
only way to get back at the strappers in your town and CBers in
general. "Pa'a ka waha"... shut your trap boy and take the pain.

..as Good Time 135 would put it,
"I am the worlds most talked about, crybabies most hated..."

Source record: 36037

You would be right if we were strictly talking about audio... but we are not. Think about what the AM mode is all about. It's not really an audio wave at all. It's an RF wave... being modulated in size at an audio rate. This is why your statement is incorrect. The RF wave is easily cleaned up by the tank even though it's changing size at an audio rate. I would certainly agree that a pure audio wave has no business being amplified by a class C amp...

Yeah you are right. What I do on the air is try to explain this to
newer SSB users. Then give them a chance to set up and operate
their radio in a intelligent way. Namely being able to tell where you
are moving your own transmit and not depending on someone else to
guide you.

After that if they still can't land on frequency then I have no
patients with them and either exclude them or tell them to go back
to AM until they figure out how to run their radio.

I can only spend so much time telling someone how to operate
their radio. After a while I give up.

I give up again.

Tim, I can tell you with out hesitation the peak watts of the daveamps the 1x2 will do 650-700+/- peak watts at 15 volts and 1300+/- watts at 21 volts, as well a m400 1x4 will yield 1100 +/- peak watts at 15 volts and 2250 +/- at 21 volts, the 8 pills 2800-2900 peak at 15 volts and about 4800 +/- at 21 volts. I believe Mod Squad said his did about 4000 pep which is a little high from everyone I have ever tested, and I have tested many of them... But this also shows you how different peoples slugs read and what size slug they actually use does make a difference......

I'm not the Dave cheerleader here by any means, but a Dave 4pill at 19v usually does around 1800-2k, but that's 19, not 15. I'd expect about 1200 Byrd peak @ 15v with a Dave 4pill, but hey, maybe a grit soaks water faster in Hawaii, I'm sure he's seeing what he says he is.

>Lets get a few facts straight about your comments.....blahblah etc.

I don't know about anyone else, but wether retail or wholesale, I deal where I get the best customer service, Dave isn't it. You gain this partly by treating equally the guy that does $10k a month and $200 a month, responding to requests promptly. If you don't wish to respond to the public promptly, then sell to dealers only. You still need to respond to the dealer promptly and with respect and courtesy. This is not a common trait of Dave people.
I have my facts straight. Good day.

> 'Doc

Hey Doc,
I said take it for what it's worth. I didn't say I believe that.
I answered a question about where such idea's come from. And I
think most people have missed the point. Of course they don't
want to see the ham station! The ham station has nothing to do
with anything. It's the excuse to see the ham station that they
use. But again, I can't say this is true. Just telling the
poster where this one person (40 meter pirate) might have gotten
his ideas.
However I must say I have heard a story told by other hams about
a Texas case where the ham station inspection scam was used to
get access to a home where the gent was way behind on child
support. I can't remember the details and it may not be true but
it is type of stuff that starts the stories that the 40 meter
pirate was talking about.

have you ever dealt with dave ? On what level? Don't even tell me by e-mail.
How would you know about his customer service?...Who are dave people?
is this a prequalifiation of people that buy or sell his amps.
You are selling/buying illegal amps did you not forget this. It is not
Wal-Mart ,k-mart, or the food mart. Perhaps the other are real comfortable
selling amps to every Tom,Dick and Harry.

Please feel free to Comment

They already are involved in ways you don't think possible, more the
reason to keep
nose clean and HAVE DOCUMENTATION for without documentation, they can
fill in the blanks anyway they like, hence the ham license among other
things.

There are rogue cops and others
> that DO abuse their authority on almost a daily basis

How should they act? What is the scope of their authority and you would
be
surprized to learn somethings.

and because of
> things like the "blue code of silence", and because of the "weak
> versus the strong"

More the reason for documentation to show where I do and do NOT belong.

, and because the "one versus the many", and because
> the courts are very lenient when it comes to a cop making
> a "mistake in judgement" you don't have a chance.

You must haven't been around the courts very long, most judges take a
dim view
of BS being brought before them, however, if you keep your nose clean,
stay
away from the illegal pharmacy products and such while MYOB (Minding
Your Own Business)
everything works out very fine, I should know, I travel extensively with

my work and
am not hassled and when stopped for vehicle violations or checks, don't
rant or
rave, most of the time documentation will get you out, the 1 ticket I
did get was
caused by my speeding and the lady cop wrote it up as a 71 in a 65
instead of an 81
saving me a bundle (DA "District Attorney" later agreed to court costs
after calling the lady State Trooper and seeing how much trouble I
wasn't) (Cost-$39.00).

Overseas, corruption can be a problem but a clear head, no smart-alec
shit and a small
dash (gift) and all works out.

>
> So nip it in the bud and try not to allow big brother in your life any
> more than is necessary.
True to a degree but not having documentation can also bring on hassles.

Nope, he ain't sheople just smart. Being a wise-ass usually brings
attention
to anything and if you start hassling someone, sooner or later the
authorities
get involved after you come to their attention. What did you do to
attact attention in the first place.

Tnom,

There IS no "loophole". FCC has the authority to inspect ANY US station, licensed or not, with the exception of Federal and Military which is governed by another agency (NTIA). This is covered in the Communications Act of 1934 which created FCC and granted that agency such authority. I mean, it's not like FCC created itself and granted the agency its own powers. CB radio operates under a "blanket" authority granted by FCC. Therefore, agents may visit a station and request to inspect the equipment. If that request is refused, then that operational authority is breached due the fact that ALL stations, licensed or not, have "agreed" to allow such inspections by operating a station in the first place. Yup, that's in the rules, too. So, a ham license, in and of itself does not have any bearing on a agent's right to inspect equipment. It also states in the "questions" section of the inspection rules that an agent does not have any right to open drawers, cabinets, or other private areas in search of documents, licenses, etc; only to inspect the radio equipment itself.

It IS true that as long as you don't call attention to yourself or cause interference to others, you will likely never encounter an FCC agent in you whole life. Just because you have a CB or a ham station doesn't mean those guys will come to your house to make a "routine" inspection. Something has to happen to cause this. They don't "know" you are running a CB station, or even a ham station, as long as you don't call attention to yourself.

Now, the guy pirating on 40 meters is different. If he keeps doing it, sooner or later, somebody WILL notice. That "somebody" will contact FCC and "attract" attention to the pirate. That's when agents will come to his door and request permission to inspect his equipment. He is ASKING

for trouble. Unfortunately, some people believe they can't be found, which is not true. With technology improving day by day, it is getting ever easier to pinpoint a "bootlegger", but as long as you are operating your station within the regulations, I just bet most of us will never ever see an FCC agent. As a matter of fact, if a problem were caused by faulty equipment unbeknownst to the operator, FCC would be most co-operative in helping the station op correct it--if the op is compliant and willing during the inspection. There most likely would not be a fine or warning--and most first time visits usually result in a warning only.

I hope this helps to dispel some of the myths about the FCC "tyrants"! LOL! And I ain't connected with them in any way, but I do know the rules pretty well--I have to! After all, I'm one of those dreaded hams y'all seem to hate so much.

Best 73

Jerry

2249. Re: midland cb question

Newsgroup: rec.radio.cb

Greetings!

Say, do you have Automatic Light Dimmer/Off function in your vehicle?

If you do, re-check and possibly relocate the tap that you use to power the radio. It may trigger this function if it's on a watched feed to a circuit.

The radio constantly draws power - even for it's memory. If the circuit it's connected to, senses the current draw, it will "fade" out thinking someone left the lights/circuit on.

Otherwise, the "intermittent" problem could be more major, as far as Ohio area, sorry I'm in Michigan. But, check the fuses, re-check power.

Worse case? Faulty power switch. Not a big deal. It just might be something simple as a solder joint break from vibration. A little re-touch of the soldering pencil and it's fine.

On Tue, 16 May 2000 13:55:31 -0400, while the modem was pondering it's navel, Scott King <King.24@wright.edu> dissertated the following:

> I was given a Midland CB (model 77-104A) a while ago, and I just

From: Dean Arthur <dearthur@silverstar.com>
Message-ID: <3921D416.3F9C@silverstar.com>
Source record: 36085

Any radio using a EEPROM/EPROM/PROM/ROM to control, merely needs a set of piggybacked chips with the Vcc lead to a panel switch to select the number of channels limited by the number of bytes on the chip.

My CP-300 has two 128-byte EPROMs piggy-backed onto the 40-byte programmed chip soldered onto the board. The Vcc lead into the board was clipped and wired to the switch on the panel, giving me 296 channels. 128 below Channel 1 at 26.965 and 128 above Channel 40 at 27.405.
